THE MODERN WORLD DICTIONARY OF THE ENGLISH LANGUAGE

VOLUME THREE

INTER—S

PREFATORY NOTE

The principal points in which THE ECLECTIC DICTIONARY differs from other dictionaries are fully discussed in the Preface, but it may be well to draw attention to the following:

(1) Compound Words are inserted under the first element of the compound, and not in the place they would occupy in strictly alphabetical order, if the second element were taken into account. Thus, ANT-BEAR is inserted after ANT, and not after ANTATROPHIC.

(2) The Pronunciation is indicated by diacritical marks, a key to which will be found at the foot of the several pages, but the division into syllables has been based solely on pronunciation, and with no reference to the etymology of the word. In syllables wherein two or more vowels come together, not forming diphthongs, only that one of them which gives its sound to the syllable bears a diacritical mark, the others being treated as mute. Thus, in *brĕad*, *sēa*, *flōat*, the *a* is mute, the syllables being pronounced as if spelt *brĕd*, *sē*, *flōt*. Words of more then one syllable bear a mark upon the accented syllable, as *âl'-tĕr*.

(3) The Etymology will be found inclosed within brackets immediately following each word. To understand the plan adopted, let it be noted (1) that retrogression is made from modern languages to ancient; and (2) that when after a word there appears such a derivation as this—"In Fr. . . . Sp. . . . Port. . . . . Ital. . . . from Lat. . . . .," the meaning is, not that it passed through Italian, Portuguese, Spanish, and French before reaching English, but that there are or have been analogous words in French, Spanish, Portuguese, and Italian, all derived, like the English, from a Latin original.

1. *In the Roman Church:* Words recited by the priest in saying Mass, after the Confiteor, as soon as he has ascended the altar. The custom of reciting the Introit is of early origin, and has been attributed to Gregory the Great. The words are usually from some psalm, formerly recited entire, and have an antiphon, and are followed by a Gloria; in some cases they are taken from other portions of Scripture, and occasionally from uninspired writers. The old English word is office, which corresponds to the Latin *officium*, by which name the Introit is known in the Mozarabic, Carthusian, Dominican, and Carmelite missals. At High-mass and in a Missa Cantata the Introit is sung by the choir, as the priest commences the Mass.

2. *In the Anglican Church:* A short anthem, psalm, or hymn, sung while the minister proceeds to the table to commence the Communion service. Formerly, in some English cathedrals, the Sanctus was sung as an Introit. This practice arose probably from the fact that the Communion Service soon after the Reformation ceased to be performed chorally, a proof of which is found in the fact that for nearly two centuries—namely, from 1660 to 1840—the Sanctus was never set to music except as an Introit, nor was the *Gloria in excelsis* set but as an anthem.

Longfellow: Dedication.

intrusive-rocks, *s. pl.*

Geol.: Rocks of igneous origin which have forced their way through crevices or rents in sedimentary strata, or have broken them up.

¶ Intrusive sheets of eruptive rock may be distinguished from true lava flows which have been subsequently overlaid conformably by sedimentary strata, by the fact that the rocks, both above and below the intrusive sheets, are altered at the contacts, while in the case of lava-flows the rocks over which they ran have been altered, but the deposits above them show no trace of metamorphism. (*Rutley: Study of Rocks*, 2nd ed., p. 32.)

ĭn-trû'-sĭve-lў, *adv.* [Eng. *intrusive*; *-ly.*] In an intrusive or iutruding manner.

* **ĭn'-tū-ĭte,** *v.t.* [Lat. *intuitus*, pa. par. of *intueor*.] [INTUITION.] To perceive by intuition.

"As mathematical quantities only come into existence by being *intuited* or constructed, so the pure concepts only exist when they are thought."—*G. H. Lewes: Hist. Philosophy* (1880), ii. 512.

ĭn-tū-ĭ'-tion, *s.* [Fr., from Lat. *intuitus*, pa. par. of *intueor* = to look in or within: *in-* = into, and *tueor* = to look; Sp. *intuicion*; Ital. *intuizione.*]

I. *Ord. Lang.:* The act of looking on; a sight, a view; a regard, an aim.

"His disciples must not onely abstain from the act of unlawful concubinate, but from the impurer *intuition* of a wife of another man."—*Bp. Taylor: Great Exemplar*, pt. ii., § 36.

II. *Phil.:* A term borrowed from Scholastic Theology, where it signifies a knowledge of God supernaturally obtained, and, by consequence, superior to knowledge obtained by ordinary methods. In passing into the service of Philosophy the word intuition has retained in some measure the idea of superiority, or at least of priority. In the French and Scotch schools all beliefs and judgments presenting themselves spontaneously to the mind, with irresistible evidence, but without the assistance of reasoning or reflection, are called intuitions, axioms, first principles, principles of common sense, or self-evident truths, and the recognition of these intuitions is the fundamental doctrine of Intuitionalism. Reid (*Essay on Intell. Powers*, ess. iv.) enumerates twelve first principles or intuitions of contingent truths:

(1) Everything exists of which we are conscious. (2) The thoughts of which I am conscious are the thoughts of a being called myself. (3) The things which I remember did really happen. (4) We may be certain of our identity as far as we remember. (5) The things which we perceive exist, and are what we perceive them to be. (6) We have some power over our actions and the determinations of our wills. (7) The natural faculties by

which we discriminate truth from error are not fallacious. (8) There is life and intelligence in our fellow-men. (9) Certain features and gestures indicate certain thoughts and dispositions of the mind. (10) Human testimony naturally awakens confidence. (11) In respect to events depending on human volition, there is a self-evident probability, greater or less. (12) In the phenomena of nature, what is to be will probably be like to what has been in similar circumstances.

In the school of Kant the word intuition (*Anschauung*) is nearly synonymous with perception. (See extract, and for Schelling's teaching, see ¶ *Intellectual Intuition.*)

"*Intuition* is Beholding; considered subjectively it is a mental operation; objectively, it is the product of that operation, the Beheld. Time and Space may therefore be considered as pure forms of the mental operation Beholding; or as products of that operation. In the one case they are transcendental, in the other empirical. Just as we speak of Sensation in general, and of particular sensations, so Kant speaks of Intuition as the general faculty, and of intuitions as the acts and products of that faculty."—*G. H. Lewes: Hist. Philosophy* (1880), ii. 513.

¶ *Intellectual Intuition:*

Metaph.: (For def. see extract).

"In both [the Alexandrian and German Schools] the incapacity of Reason to solve the problems of Philosophy is openly proclaimed: in both some higher faculty is called in to solve them. Plotinus called this faculty Ecstasy. Schelling called it the *Intellectual Intuition.* The Ecstasy was not supposed to be a faculty possessed by all men, and at all times; it was only possessed by the few, and by them but sometimes. The *Intellectual Intuition* was not supposed to be a faculty common to all men; on the contrary, it was held as the endowment only of a few of the privileged: it was the faculty for philosophizing."—*G. H. Lewes: Hist. Philosophy* (1880), ii. 577.

ĭn-tū-ĭ'-tion-ăl, *a.* [Eng. *intuition; -al.*] Pertaining to, derived from or characterized by intuition; intuitive.

intuitional-reason, *s.*

Phil.: (See extract).

"By *Intuitional Reason* I here wish to express what the Germans call *Vernunft*, which they distinguish from *Verstand*, as Coleridge tried to make Englishmen distinguish between Reason and Understanding. The term Reason is too deeply rooted in our language to be twisted into any new direction, and I hope by the unusual '*Intuitional Reason*' to keep the reader's attention alive to the fact that by it is designated the process of the mind engaged in transcendental enquiry."—*G. H. Lewes: Hist. Philosophy* (1880), i., liv.

ĭn-tū-ĭ'-tion-ăl-ĭşm, *s.* [Eng. *intuitional; -ism.*]

The heads are panicled, corymbose, or solitary rayed, yellow; the involucre campanulate, the bracts in many series, the receptacle flat, naked; the ray flowers female or neuter, in one series ligulate; the dark flowers tubular, having two sexes; the fruit terete or angled, the pappus in one series, scabrous. About fifty species are known, of which the only important one is the Common Elecampane, *I. Helenium*, a native of Europe, and an escape in the United States. It was once much valued for its medicinal root, but is now neglected.

2. *Pharmacy:*

(1) [ELECAMPANE, INULIN.]

(2) The dry roots of *Inula racemosa*, a West Himalayan and Cashmere plant, have a weak aromatic odour like orris, and act as a mild tonic. They are used in veteriuary medicine. (*Watts.*)

ĭn-ū'-a-mīde, *s.* [Lat. *inul(a)*, and Eng. *amide.*]

Chem.: $C_{14}H_{20}(OH)CO, NH_2$. A compound obtained by passing ammoniacal gas into an alcoholic solution of inulic anhydride. It crystallizes in feathery crystals, sparingly soluble in alcohol. It melts at 210°, undergoing decomposition, and is very feebly basic.

Bot.: A sub-tribe of tubuliferous composites, tribe Asteroideæ.

ĭn'-u-lĭc, *a.* [Lat., &c. *inul(a); -ic.*] Derived from the genus Inula (q.v.).

inulic-acid, *s.*

Chem.: $C_{15}H_{22}O_3 = C_{15}H_{20}O_2 + H_2O$. A monobasic acid, prepared by heating inulic anhydride with dilute potash, and decomposing the salt formed with hydrochloric acid. It crystallizes in delicate needles, melting at 90°, and is sparingly soluble in water, but very soluble in alcohol. When heated above 90°, it gives off its water, and is converted into the anhydride. The potassium and sodium salts are very soluble in water and in alcohol, but crystallize with great difficulty. The ammonium salt is very unstable, decomposing on simply evaporating the solution. The silver salt, $C_{15}H_{21}AgO_3$, crystallizes in small brilliant scales. When inulic acid is dissolved in absolute alcohol, and dry hydrochloric acid gas passed into the solution, large colourless rhombic crystals are formed, which melt at 140°, decomposing and giving off hydrochloric acid. This crystalline body forms salts, but they are very unstable. Its formula is $C_{15}H_{21}O_2Cl$.

inulic-anhydride, *s.*

Chem.: $C_{15}H_{20}O_2$. A white crystalline substance, obtained by distilling elecampane root with steam, pressing the crystals between blotting-paper, and recrystallizing from alcohol. It is almost insoluble in water, but very soluble in alcohol and ether. It melts at 66°, and boils at 275° with partial decomposition.

ĭn'-u-lĭn, ĭn'-u-lĭne, *s.* [Lat., &c. *inul(a); -in, -ine* (*Chem.*) (q.v.).]

Chem.: $C_6H_{10}O_5$. A soft white tasteless powder, isomeric with and similar in its properties to starch, discovered by Valeutin Rose in 1804. It is very widely distributed throughout the vegetable kingdom, being found in the roots of elecampane, dandelion, chicory, feverfew, in the tubers of the potato, the dahlia, and the Jerusalem artichoke, in the seeds of the sun-flower, and in many other plants. It is usually prepared from the sliced or rasped roots of the elecampane or the dahlia, by boiling with water in the presence of sodium carbonate. The liquid obtained is cooled by a freezing mixture, when the inulin precipitates. To obtain it pure, it is dissolved in hot water, filtered, and again exposed to a freezing mixture. On repeating this process three or four times, the inulin is obtained perfectly white. It is insoluble in alcohol, slightly soluble in cold water, but very soluble in boiling water. It dissolves in an ammoniacal solution of cupric oxide, the solution yielding, after a few hours, a blue amorphous precipitate, insoluble in water and in ammonia, but soluble in tartaric acid. Its specific gravity is 1·349, and its optical lævorotatory power $[\alpha]_D = 34·6$. When heated with water in sealed tubes at 100°, or when boiled with dilute sulphuric acid, it is converted into a sugar, which has all the properties of levulose. Inulin is distinguished from starch by its giving a yellow or yellowish-brown instead of a blue colour with iodine; by its solubility in aqueous cuprammonia, and by its inalterability under the influence of ferments. It appears to be a substance intermediate between gums and starch. Inulin has lately been examined by H. Kiliani. He assigns to it the formula, $C_{36}H_{62}O_{31} = 6C_6H_{10}O_5 + H_2O$.

ĭn'-u-lōl, *s.* [Lat. &c. *inul(a)*; Eng., &c. (*alcoh*)*ol* (?)].

Chem.: $C_{10}H_{16}O$. A yellowish liquid, having an aromatic taste and an odour of peppermint, obtained by distilling elecampane root, *Inula Helenium*, with steam. The white crystalline mass which comes over is pressed between blotting-paper, which absorbs the inulol, and this may be afterwards recovered in a tolerably pure state by distilling the paper with steam. It boils at 200°, and, when distilled with phosphorus pentasulphide, a hydro-carbon, $C_{10}H_{14}$, is obtained, which boils at 175°.

Addition and subtraction are inverse operations, for, if we add to a the quantity b, and from the sum subtract the quantity b, the result will be a. Multiplication and division, raising to powers and extracting roots, differentiation and integration, are all inverse operations. If two variable quantities are connected by an equation, either one is a function of the other. If it be agreed to call the first a direct function of the second, then is the second an inverse function of the first. The forms of direct and inverse functions, as dependent upon the connecting equation, may be determined by solving the equation with respect to each function separately.

Inversion may also take place in the presence of ferments, or by prolonged boiling with water.

6. *Mus.:* The transposition of certain phrases having a commou root. (1) The *inversion* of a chord is effected by making one of the inner notes act as a bass note, and by this means as many *inversions* can be made as there are actual notes in the chord, uot couuting the root. In such inversions the harmony remains the same, although the order of component parts is changed. (2) Intervals are inverted by making that which was the upper note the lower, and the reverse. The *inversion* of an interval within the octave may readily be found in the difference between the figure 9 and the interval known; then an interval of a second becomes a seventh by *inversion*, &c. (3) The *inversion* of a subject is produced by inverting the intervals of which it consists.

1. *Ch. Hist.:* If any bishop or other clergyman have the cure of souls and also a stipend, two elements, the one sacred and the other civil, exist in his position; and as nearly every spiritual act carries civil consequences, and nearly every civil act connected with his benefice has sacred effects, scarcely any prudence can avoid periodical collision between the ecclesiastical and the civil power. From the kingly or imperial point of view, a great political object will be served if the church can be made simply a tool in the hands of the civil government. From the papal point of view, and indeed from that of all church functionaries, a great ecclesiastical end will be achieved if the State can be made an obedient handmaid of the Church. From the establishment of the Church under Constantine the Great, in the fourth century, the Roman functionaries increasingly interfered in ecclesiastical affairs, and by the eleventh lay patronage had been much abused, and simony largely prevailed. The emperors, kings, and princes of Europe had been accustomed to confer the temporalities of the larger benefices and monasteries by the delivery of a ring and a staff, or crozier. When the bishop or abbot elect had received these, he carried them to the metropolitan, who returned them, to indicate that the Church had conferred on him sacred office. Pope Gregory VII. (Hildebrand) considered that a ring and a crozier were insignia of spiritual office, and not of its temporal accompaniments, the crozier symbolising the pastoral charge and the ring the celestial mysteries. He therefore wished the then reigning emperor, Henry IV., to desist from conferring investitures in such a form, or indeed at all. The emperor was willing to see simony terminated, but clung to investitures, and Gregory on his part threatened to excommunicate any one conferring such investitures or receiving them. A fierce contest now arose between Henry and Gregory, continued by their successors. At last the poutiff's legates and the emperor came to an arrangement at the Diet of Worms, A.D. 1122, one article of the treaty being that the emperor should confer the temporalities of a see or abbacy by some other symbols than the sacred ones of the ring and the crozier.

Irish Hist. (Pl.): An Irish secret society, not identical with, though it developed from, that of the Fenians, in or prior to 1882. One of the main objects of the Invincibles was to "remove" (a euphuism for "to assassinate") government officers or others who might incur the displeasure of the association or its leaders. On May 6, 1882, it achieved what doubtless it deemed a great victory, having on that day succeeded in "removing," *i.e.*, in stabbing to death, Lord Frederick Cavendish, who had just arrived from England as Secretary for Ireland, and Mr. Thomas A. Burke, the Under-Secretary, in the Phœnix Park at Dublin. The plot was directed against the latter gentleman, and the former, nobly interfering to protect his friend, shared his fate. The nefarious deed arrayed against the unknown murderers the moral feeling of the civilized world, and the government soon overcame the "Invincibles." On February 20, 1883, twenty charged with complicity in the Phœnix Park murders were put on trial; on July 14, Joseph Brady, who had been convicted of actual perpetration of the murder of Mr. Burke, was executed, as were others subsequently. The leading witness, who revealed all the secrets of his fellow conspirators, was one James Carey, a member of the common council of Dublin. He was shot dead in a steamboat near Natal, on July 29, by an Irishman, O'Donnell, who was subsequently brought to England, tried, and executed for his crime in December, 1883.

¶ *Invocation of Saints:*

1. *Roman Theology, &c.:* The authoritative statement of Roman doctrine on this subject is found in a decree of the Council of Trent (sess. 25, held Dec. 3 and 4, 1563), which ordains that "all bishops and others having the duty of teaching" should instruct the faithful—

"That the saints reigning with Christ offer their prayers to God for men; that it is good and useful to invoke them, and to have recourse to their prayers, succour, and assistance to obtain benefits from God through his Son Jesus Christ, our Lord, who alone is our Redeemer and Saviour."

Here two propositions are laid down in the plainest possible manner:—(1) That the saints do intercede for men; (2) the utility of asking such intercession. Theologians allege Scripture and tradition in support of the doctrine and practice (cf. Jer. xv. 1; Luke xv. 7; Rev. v. 8, vi. 9–11, viii. 3). The chief argument is from analogy; the oneness of the mystic Body of Christ (1 Cor. xii. 12); the duty of mutual prayer, and the efficacy of the prayers of the just on earth (James v. 15–18); and the value which St. Paul set on the prayers of his fellow-Christians (Eph. vi. 18, 19; Col. iv. 3, 4; 2 Thess. iii. 1). But on the other hand cf. 1 Tim. ii. 5. It should be noted that the saints are asked to intercede for men, and not to bestow of their own power either temporal or spiritual blessings. Inscriptions in the Catacombs show that the practice was common in the Early Church, and mention of it is made by St. Gregory Nazianzen (*Orat.* xxiv.), St. Basil (*Orat.* xliv.), St. Gregory Nyssen (*Orat. in S. Theod.*), St. Ambrose (*De Vid.*, cap. xi. n. 55), and St. Augustine (*Serm.* 324; *cont. Faust.* xx. 21). The devotion of the Church is chiefly towards the saints who died after Christ. To the Maccabees alone is a feast celebrated in the whole Latin Church. (The texts are from the A.V.; the Fathers from Migne.)

2. *Anglican Theology, &c.:* There were very many reasons why, when the *Articles of Religion* were "ratified and confirmed," the separation between the Reformed and Roman Churches should be made as marked as possible, and the twenty-second of the Thirty-nine Articles strongly condemns the invocation of saints. The Liturgy is less unfavourable to the doctrine. In the canticle *Benedicite, omnia opera*, from the apocryphal portion of Daniel, the "Angels of the Lord" (Dan. iii. 58 in the Vulg.) and the "Spirits and Souls of the Righteous" (iii. 86) are called upon to "bless the Lord," to "praise him and magnify him for ever." Here there seems to be an admission that angels and the departed just hear the invocations of, though there is no declaration as to their intercession for, members of the Church militant. The practice, as a private devotion, was known in Caroline days, and lingers, in a debased form, in country districts, in the rhyme—

"Matthew, Mark, Luke, and John,
Bless the bed that I lie on," &c.

With the Oxford Movement the doctrine of the Invocation of Saints came to the front. Keble (*Visitation of the Sick*) wrote—

"O soothe us, haunt us, night and day,
Ye gentle spirits far away,
With whom we shared the cup of grace,
Then parted; ye to Christ's embrace."

¶ *Inward* is employed more frequently to express a state than to qualify an object; *internal* qualifies the object: a thing is said to be turned *inward* which forms a part of the inside: it is said to be *internal* as one of its characteristics; *inward*, as denoting the position, is indefinite; any thing that is *in* in the smallest degree is *inward:* but that is properly *internal* which lies in the very frame and system of the body: *inner* which rises in degree on *inward*, is applicable to such bodies as admit of specific degrees of euclosure: so

likewise *interior* is applicable to that which is capacious, and has many involutions, as the *interior* coat of the intestines. (*Crabb: Eng. Synon.*)

iodacetic-acid, *s.*

Chem.: $CH_2I{\cdot}CO{\cdot}OH$. On heating in the dark, an alcoholic solution of ethylic bromacetate with potassic iodide, a brown oil, ethylic iodacetate is obtained. This, on being saponified by a solution of baric hydrate, and the resulting soap decomposed by sulphuric acid, gives a solution of iodacetic acid. It crystallizes in thin, colourless, rhombic plates, which melt at 82°, and decompose at higher temperatures. It is very soluble in water, but does not deliquesce in air. The iodacetates of potassium, sodium, and ammouium are all very soluble, crystalliue, and non-deliquescent. The bariuu salt is slightly soluble in water, but is precipitated by alcohol. The silver salt readily decomposes in presence of water into argentic iodide and glycollic acid. The iodacetate of ethyl is an oily liquid, heavier than water, and possessing an irritatiug odour.

ī-ō-dīne, *s.* [Gr. ἰώδης (*iōdēs*)=violet-coloured; Eng. suff. *-ine.*]

I. *Chem.:* Iodine is a haloid monatomic element; symbol I; atomic weight 127. Obtained from the ash of sea-weeds called kelp; this is treated with water, filtered and evaporated to a small bulk; potassium and sodium salts crystallize out and the dark-brown mother liquid is then mixed with sulphuric acid and manganese dioxide, and, gently heated in a still, the iodine distils over and is collected in a receiver.

$2HI + MnO_2 + H_2SO_4 = MnSO_4 + 2H_2O + I_2$.

The iodine of commerce is generally impure; it may be purified by dissolving it in a solution of potassium iodide till it is saturated, adding water which precipitates pure iodine. Iodine crystallizes in dark gray rhombic crystals, having a metallic lustre resembling graphite; sp. gr. 4·95. It melts at 107° and boils at 175°. Its vapour is of a deep blue colour; when less dense it has a violet colour. Iodine dissolves in 7000 parts of water; it is soluble in alcohol, ether, chloroform, and in carbon disulphide. Iodine stains the skin brown, and is soluble in potassium iodide. At ordinary temperatures iodine is slightly volatile, and has a peculiar smell. A small trace of iodine can be detected by its giving a blue colour to starch. The blue colour is destroyed by heat but reappears on cooling. Iodine unites with other elements and radicals, forming iodides. Its affinity for oxygen is greater than that of chlorine, but it has a less affinity for hydrogen, hence hydriodic acid is easily decomposed by chlorine.

ī-ō-dō-phē′-nōls, *s. pl.* [Pref. *iodo-*, and Eng. *phenol* (q.v.).]

Chem.: $C_6H_4I{\cdot}OH$. By the action of iodine and iodic acid on phenol, in presence of an alkali, a mixture of three isomeric mono-iodophenols is obtained. When this is distilled in a current of steam, first a liquid, ortho-iodophenol, passes over, then a solid, meta-iodophenol, and lastly, at a higher temperature, tri-iodo-, or para-iodophenol. Mus.: One of the ecclesiastical modes, commencing on the note C, corresponding exactly in tonality with the major diatonic scale as used in modern music. [Mode.]

Ionian-school, *s.*

Philos.: The first school of Greek philosophy, the distinctive characteristic of which was its inquiry into the constitution of the universe. Thales of Miletus opened the inquiry. The common notion that he taught "the principle of all things was water," must be taken with a distinction. Water, as the principle of Thales, was not water in any determinate form, but water instinct with vital energy, capable of taking an infinite number of forms. This doctrine appears in Hesiod (*Theog.*, 133–136); and the "*ariston men hudōr*" of Pindar (*Olymp.*, i. 1) is proverbial. Thales is usually spoken of as the founder of the Ionian school; he was more—he was the father of Greek speculation. He prescribed no method, and those who followed him did not accept his answer to the question, What is the Beginning of all things? But the special claim of Thales to notice lies in the fact that he was the first to ask the question, and the first to attempt to establish a physical Beginning.

"The whole ordinary arrangement of the *Ionian School* seems to have proceeded on the conviction that each disciple not only contradicted his master, but also returned to the doctrines of his master's teacher." —*G. H. Lewes: Hist. Philos.* (1867), I. 8.

Ionic-mode, *s.*

Mus.: [Ionian-mode].

Ionic-order, *s.*

Arch.: One of the five orders of architecture, the distinguishing characteristic of which is the volute of the capital. Its main features are the same as in the Doric style; their forms, however, are different. The Ionic order has more mouldings, its forms are richer and more elegant, and, as a style, it is lighter and more graceful than the Doric. The Doric order has been compared to the male, and the Ionic to the female figure. The Ionic columu has a less diminished shaft and a smaller parabolic curve than the Doric. It is, like the Doric, channelled; the flutings, which are twenty-four in number, are separated by anuulets, and are therefore narrower, but at the same time deeper, than the Doric, and are terminated at the top and bottom by a final curvature. The coIumn has a base, which, as essential parts, has a moulded or plain cavetto with a torus above, or the torus is placed above two cavetti, which are themselves separated by several intervening mouldings. The so-called Attic base is the form which most frequently occurs, and cousists of two tori separated by a cavetto, the whole having a plinth as basis. In the capital the Doric echiuus is replaced either by a cyma ornameuted with leaves, or, more generally, by an ovolo with a pearl-beading beneath. Instead of the Doric abacus there occurs a cushiou-like band in its place, whose ends, wound in a spiral shape and coiled with elastic force, when viewed either from in front or behind, form volutes, which on both sides considerably exceed the diameter of the column, and also surpass the architrave in breadth. These volutes, or scrolls, when viewed from the side, appear to meet iu the middle, and form a wavy line over the echinus. The architrave consists of several faciæ, which project slightly one over the other, and which are separated by small hollowed mouldings and capped by a moulded baud. The frieze is undivided, either plain or with arabesques representing either implements used in worship or simple plants. The frieze also bears the name of the zophorus. As regards the proportions of the Ionic order, no such remarkable difference as in the Doric is perceptible in the monuments which have been preserved to us. The height of the column is from eight and a-half to nine times the lower diameter; the distance between the columus averages about twice the diameter, while the height of the entablature is not quite one quarter that of the column. The most perfect specimens of the Ionic order are the temples of Minerva Polias and of Erectheus in the Acropolis at Athens, and of Fortuna Virilis and the Coliscum at Rome.

1. *Bot.:* The plants producing the drug described under 2.

2. *Pharmacy:*

(1) The dried root of *Cephaelis Ipecacuanha*, a cinchonaceous plant from Brazil. [Cephaelis.] The ipecacuanha from that country is called annulated, to distinguish it from the striated kind from Peru. It arrives from Rio Janeiro and elsewhere in coutorted pieces, two to four inches long, about the size of a small quill, and knotted. The smell of ipecacuanha is slight, but disagreeable; the taste bitter, aromatic, and slightly acrid. The active ingredients reside chiefly in the cortex. It contains a feeble alkaloid called ceretin. Its preparations are pills, powders, lozenges, and wine. In large doses it is an emetic; in smaller ones it is an expectorant and an alterative. It is considered a specific in dysentery. "Dover's powder" is a compound powder of ipecacnanha; it is diaphoretic. Ipecacuanha, made into ointment, is a counter-irritant.

(2) Various other plants produce a similar drug, as, for example, all the Alsodineæ, a tribe of Violaceæ. So also the root of *Euphorbia Ipecacuanha* is said by Barton to be at least as good as the genuine ipecacuanha.

¶ The Ipecacuanha of Cayenne is *Ionidium Itubα*; that of Guiana is the root of *Boerhaavia decumbens*, one of the Nyctagos; that of Venezuela is the root of *Sarcostemma glaucum*, an Asclepiad; Black Peruvian or Striated Ipecacuanha is *Psychotria emetica*; the False Ipecacuanha of Bourbon is *Camptocarpus mauritianus*; False Brazilian Ipecacuanha is *Ionidium Ipecacuanha*; Undulated Ipecacuanha is *Richardsonia scabra*; White Ipecacuanha is (1) *Ionidium Ipecacuanha*, (2) *Richardsonia scabra*, (3) in India, *Tylophora asthmatica*, and the Wild Ipecacuanha of the West Indies is *Asclepias curassavica*, called also Bastard Ipecacuanha.

Ī-rĭd'-ĭ-ŭm, *s.* [Gr. ἶρις (*iris*) = the rainbow, and εἶδος (*eidos*) = form, appearance.]

I. *Chem.:* A tetrad metallic element, symbol Ir.; atomic weight 198; discovered by Descotils in 1803, and by Tennant in 1804, in the black powder which remains when crude platinum is dissolved in nitro-hydrochloric acid. This powder is an alloy of iridium and osmium, called iridosmine or osmiridium. To separate the iridium from the alloy, the black powder is mixed with an equal weight of dry sodium chloride, and heated to redness in a glass tube, through which a stream of moist chlorine gas is transmitted. The further end of the tube is connected with a vessel containing ammonia. Iridium chloride and osmium chloride are formed: the former remains in the tube in combination with the sodium chloride, whilst the latter, being a volatile substance, is carried forward into the receiver where it is decomposed into osmic and hydrochloric acids, which combine with the ammonia. The iridium and sodium chloride left in the tube is dissolved in water, mixed with an excess of sodium carbonate and evaporated to dryness. The residue, after ignition in a crucible, is reduced by hydrogen at a high temperature, and treated successively with water and concentrated hydrochloric acid, by which all impurities are removed, and the metallic iridium left in a finely divided state. Iridium is a white, brittle, very hard metal, fusible, with great difficulty, in the flame of the oxy-hydrogen blowpipe. It is insoluble in all acids, but when reduced by hydrogen at a red heat it oxidizes slowly and dissolves in nitro-hydrochloric acid. Iridium forms four oxides—IrO, Ir_2O_3, IrO_2, and IrO_3. The monoxide, or hypo-iridious oxide, IrO, is but little known. The sesquioxide, or iridious oxide, Ir_2O_3, is unstable, having a great tendency to absorb oxygen and become dioxide. The dioxide, or iridic oxide, IrO_2, is the most easily prepared and the most stable. It is prepared by boiling a solution of iridic chloride with an alkali. The trioxide, or periridic oxide, IrO_3, is unknown in the free state, but is found in combination with potash as a black crystalline powder, when iridium is fused with nitre. Iridium forms four chlorides—$IrCl$, $IrCl_2$, Ir_2Cl_6, and $IrCl_4$—but only two of them have been obtained in definite form—viz., the trichloride, or iridious chloride, Ir_2Cl_6, and the tetrachloride, or iridic chloride, $IrCl_4$. Iridious chloride combines with other metallic chlorides, forming compounds, called iridosochlorides, which are all olive-green pulverulent salts. Iridic chloride also unites with alkaline chlorides, forming iridio-chlorides, which are all of dark brown colour. There are three iodides of iridium analogous to the chlorides, and three sulphides analogous to the first three oxides. Iridic solutions give, with ammonium or potassium chloride, a crystalline precipitate, which is distinguished from the platinum precipitate by its reddish-brown colour.

Ī'-rĭs (pl. **Ī'-rī-dēş**), *s.* [Lat. *iris* = Gr. ἶρις (*iris*) = rainbow.]

I. *Ord. Lang.:* The rainbow.

II. *Technically:*

1. *Anat.:* The coloured portion of the eye surrounding the black central pupil. It consists of three layers, an anterior epithelial layer, a posterior layer of pigment called the uvea, and a middle fibrous layer.

2. *Bot.:* The typical genus of the order Iridaceæ (q.v.). The perianth is regular, its segments unequal; sepals large, stipulate, reflexed; petals smaller, sub-erect, stipulate; stigmas three, very broad, petaloid. About forty-eight are known, all from the north

temperate zone. Two are British, *Iris Pseudacorus*, the Yellow Flag, common on river banks, canals, &c., and *I. fœtidissima*, the Fetid Tree or Roast-beef plant, with blue purple flowers, and occurring chiefly in chalk or limestone districts. Other species are escapes. The roasted seeds of *I. Pseudacorus* are like coffee. It is a diuretic purgative and emetic, as are *I. tuberosa*, *I. versicolor*, and *I. verna*. *I. Florentina* furnishes the violet-scented orris-root, which is slightly stimulating. It is used in the preparation of the sweet-scented otto of roses.

IRIS.

I. ensata has been supposed to furnish the irisa root of India. Dr. Stewart says that it is used externally in the treatment of rheumatism. In Chumba the root and leaves are given in fever. The purple flowers of *I. germanica* and *I. sibirica*, treated with lime, furnish a green colour. *I. sibirica* is anti-syphilitic; *I. fœtidissima* is said to be a cure for scrofula.

¶ The Peacock Iris is the genus Vieusseuxia, the Scorpion Iris *I. alata*, and the Snake's-head Iris *I. tuberosa*, or *Hermodactylus tuberosus*. The name iris is given to the genus because of the variety and beauty of the colours in the flowers.

Irish Presbyterian Church, *s.*

Ecclesiol. & Ch. Hist.: A Presbyterian Church, formerly called the Synod of Ulster, as having its strength mainly within that province of Ireland. Its members are mostly descended from the Scotch Presbyterians, who came over by invitation of James I., between 1609 and 1612, to colonize Ulster. [IRISH SOCIETY.] The Church still remains identical in doctrine with the Scottish Establishment. In 1672 Charles II. conferred upon its members a small "Regium Donum" (Royal Gift). This having lapsed, was revived by William III. in 1690, and continued till the passing of the Irish Church Act in 1871. Compensation was given by the Act to the then living ministers entitled to the gift. By the spontaneous transference of this money to the synod, the nucleus of a sustentation fund was obtained, and soon considerably developed by voluntary contributions. By the census of 1881 the Presbyterians in Ireland amounted to 485,503, the vast majority belonging to the Irish Presbyterian Church. In that year it had 36 presbyteries, 621 ministers, 557 congregations, 103,548 communicants, 78,820 families, 8,514 Sunday-school teachers, and 87,047 Sunday-scholars. It raised for all religions and charitable purposes £140,749.

Irish Society, *s.*

Hist.: A committee of citizens belonging to twelve London Companies, invited by James I. in 1613 to take part in cultivating the confiscated lands in Ulster, which, to the extent of 511,465 acres, had become vested in the Crown. The society in large measure built Londonderry, though walls and bastions had been erected there as early as 1609. They largely colonized the county of the same name, which was bestowed in honour of the twelve London companies. The full title of the society is the Honourable Irish Society.

A. *As substantive:*

I. *Ordinary Language:*

1. *Literally:*

(1) In the same sense as II. 5.

(2) An article made of iron; spec., one for ironing clothes.

2. *Fig.:* Anything strong, hard, or unyielding.

II. *Technically:*

1. *Bot.:* A minute quantity of ferric oxide, Fe_2O_3, is necessary to the healthy growth of plants.

2. *Chem.:* Ferrum, a metallic tetrad element, symbol Fe, atomic weight 56*, sp. grav. of pure iron 7·8. Iron occurs nearly pure or alloyed with nickel in meteorites, but is generally found in combination with oxygen and as a carbonate. It is widely diffused in rocks, and often forms the chief colouring matter of clays and sands. It also occurs combined with sulphur. The chief ores used for the manufacture of iron are Magnetite, Hæmatite, Brown oxide, Spathic ore, and Clay ironstone. The ore is first calcined, to expel the water and carbonic acid and most of the sulphur, and to convert the oxides to peroxide, which prevents the waste of iron in the form of slag. The calcined ore is then smelted, with the addition of coke and limestone; the limestone unites with the silica present and forms a fusible slag, whilst the oxide of iron is reduced by the action of the carbon monoxide. [BLAST-FURNACE.] The iron thus obtained is called cast or pig iron, and is very impure. Pure iron is prepared by placing four parts of fine iron wire, cut in pieces, and one part of black oxide of iron in a Hessian crucible, and covering it with a mixture of white sand, lime, and potassium carbonate in the proportions used for glass-making; a cover is then closely applied and the crucible exposed to a very high temperature. Iron is a soft, tough, tenacious, malleable, ductile, white metal, not acted upon by dry air; but it rusts in moist air containing carbonic acid, forming a hydrate of the sesquioxide. When heated to redness in the air, it is coated with black magnetic oxide, Fe_3O_4. It burns in oxygen gas, black oxide being formed. Red-hot iron decomposes water, hydrogen being given off. Iron is magnetic; it is solnble in dilute hydrochloric acid and in dilute sulphuric acid with evolution of hydrogen. Iron unites with oxygen, forming ferrous oxide FeO and ferric oxide Fe_2O_3. Intermediate oxides are also known. The salts of iron have already been described. The alchemists represented it by the symbol of Mars ♂. [FERROUS, FERRIC, WROUGHT-IRON, STEEL.]

3. *Geol.:* Iron is widely diffused through the rocks. Many are coloured red by its oxides. It is also deposited from ferruginous springs. [IRON-ORE; BOG IRON-ORE.]

4. *Hist.:* Iron is mentioned in the Bible as early as Gen. iv. 22. Tubal Cain is described as having been an "instructor of every artificer in brass (copper) and iron." On the sepulchres of the Egyptian Thebes, butchers are depicted as sharpening their knives on a round bar of metal which, from being blue, is assumed to be iron. The steel weapons in the time of Rameses III. are also painted blue. There are with them the representations of bronze weapons, which are painted red. [IRON AGE (2).] Iron ore is said to have been discovered in Mount Ida about B.C. 1406. The Romans early knew it. There is so much iron ore in India that it must have been known from remote times. Iron mines came into operation in Britain B.C. 54, and still continue highly productive. The United States is exceedingly rich in iron, which has for many years been largely mined in Pennsylvania, while now a large product is yielded by the mines of Michigan, West Virginia, Alabama, and some other states. In Missouri whole mountains of iron ore exist. Its production from the ores has been largely increased by the substitution of coal for wood as fuel and the employment of the hot blast furnaces. The Bessemer process of converting crude iron into steel was discovered in 1856.

5. *Min.:* Native iron occurs in masses or smaller portions in meteorites. It is nearly pure, still it contains one to twenty per cent. of nickel with traces of cobalt, manganese, tin, copper, chromium, phosphorus, &c. Whether unmeteoric native iron exists is doubtful. Specimens of ore so pure as to admit of direct forging into horseshoes have been mined at Shepherd's Mountain, in the Iron Mountain district of Missouri, U.S. [METEORITE.]

6. *Pharm.:* In the hæmatin or colouring matter of the blood 6½ per cent. is iron. When anæmia occurs, the administration of iron is of much use. It acts also on the nervous system. It often, however, causes constipation, and sometimes also stains the tongue and the teeth. It may be given in the form of reduced iron lozenges, saccharine carbonate of iron, compound mixture of iron, a pill of carbonate of iron, iodide of iron, &c.

iron-clăd (iron as ī′-ĕrn), *s.* & *a.* [Eng. *iron*, and *clad*.]

A. *As subst.:* The system of plating ships with iron was first tried on some of the French floating batteries used at Kinburn in 1855; but, though the results were satisfactory, no advance was made until 1858, when the French again took the lead with the "Gloire," but were quickly followed by the first English armoured vessels of the "Warrior" class, to which were added, to strengthen the ironclad fleet, altered wooden line-of-battle ships, such as the "Royal Alfred," which were cut down and plated. All the early vessels were constructed of wood, but the later specimens have been built of iron framing, and few of the modern ships are alike. None of the early iron-clads mentioned were tested in actual warfare, the first battle of iron-clads taking place between the Monitor and Merrimac, in the early days of our Civil War. The test here applied demonstrated that the days of wooden war-ships were at an end, and this fact was still further indicated by later events of the Civil War. Since its close the nations of Europe have been busy building iron-clad vessels, of various patterns, and increasing the thickness of protective armor, as the power of rifled cannon increased. From war vessels with 3 or 4 inches of iron casting, the thickness has gradually increased, until vessels are now afloat with protective armor 24 inches thick, and with turrets plated with 36 inches of iron. Costly experiments of this kind were entered into by Britain, France, Germany, Italy, &c., while the United States held aloof, quietly watching the products of European navy yards as one by one they were rendered of questionable value by the rapidly increasing penetrative power of the great cannon now produced. About ten years ago this country actively began to build a new navy, and has now afloat a fleet of iron-clads of the finest description yet made, and steadily growing in numbers. In armoring these vessels some highly useful lessons have been learned. Steel replaced iron; and when it was found that even a great thickness of steel was incapable of resisting the power of our great rifled guns, new experiments were made, resulting in the production of a nickel-steel, of remarkable resisting powers, and of methods of hardening the surface of plates so effective that for the present the armor has won the battle, some of the newly-built American iron-clads being impenetrable by the ball of any cannon now in existence. The term iron-clad has now largely become a misnomer. Not only are many of the vessels so entitled built of steel, but steel has replaced iron generally in their armor, hence the phrase steel-clad has become a more correct designation. The monitor idea which played so interesting a part in our Civil War, has largely gone out of use, the unseaworthy character of the low-decked monitors being a serious defect in their navigation. The original monitor went to the bottom in a storm.

ironstone-china, *s.* One of the contributions of Wedgwood to the ceramic art. The materials of the Staffordshire ware are calcined flints and clay. The flints are burned in kilns, and then, while hot, plunged into water, by which they are cracked through their whole substance. They are then ground with water, in mills resembling the arrastra, to the consistence of cream. The clay, from Dorsetshire and Devonshire, is mixed with water, and in this state, as well as the flint, is passed through fine sieves to separate the grosser particles. The flint and clay are now mixed by measure, and the mixture is passed again through a sieve for better incorporation. In this state it is called *slip*, is evaporated to a proper consistence, and tempered in the pug-mill. Cups, pots, basins, and other round articles are turned rough on the horizontal potter's-wheel, and when half dried are again turned in a lathe. They are then fully dried in a stove, and polished up with coarse paper.

I. The quality or state of being irradiant; the act of irradiating; emission of rays of light upon any object.

"Love not the heavenly spirits, and how their love
Express they?—hy looks only, or do they mix
Irradiance?" *Milton: P. L.*, viii. 617.

2. That which irradiates or renders irradiant; that which is irradiated.

"Supreme *irradiance!* speed the distant ray;
Far speed the dawn of thy internal day."
Brooke: Universal Beauty, bk. vi.

Oft thro' the fleecy cloud *irradiant* bends,

Optics, Astron., &c.: A curious phenomenon, in virtue of which a star or any bright object appears larger than it really is. If a thin platinum wire be intensely heated by the passage of an electric current, it seems to a person distant about fifty feet to be as thick as a pencil. In this way the sun's diameter looks larger than it is in the sky. (*Forbes: Transit of Venus* (1874), p. 50.) While, however, a white or a bright object on a dark ground looks larger than it is, a black one on a bright ground is diminished in apparent magnitude.

A. *As subst.:* In Italian politics, one of the party of the Left, in whose accession to office in 1876 the cry of "Italia Irredenta," and pledges in favour of the recovery of the unredeemed territory, were powerful factors. Unredeemed Italy was held to include Trieste and the Trentino, in the occupation of Austria; the cantou of Ticino, in Switzerland; and Nice and Malta, in the respective possession of France and England. The taking office by the Left was viewed with alarm in many countries, especially in Austria, where the precautionary measures taken of strengthening and garrisoning the fortresses on the Italian frontier. The movement, however, had no solid foundation in the feeling of the Italian people.

"If the Italian Government has little to fear from the *Irredentists*, the Austrian Government has still less."—*Saturday Review*, Dec. 30, 1882, p. 845.

B. *As adj.:* Belonging to, or in any way connected with the Irredentists.

¶ *Irregular*, that is literally *not regular*, marks merely the absence of a good quality; *disorderly*, that is literally out of order, marks the presence of a positively bad quality. What is irregular may be so from the nature of the thing; what is *disorderly* is rendered so by some external circumstance. Things are planted *irregularly* for want of design; the best troops are apt to be *disorderly* in a long march. *Irregular* and *disorderly* are taken in a moral as well as a natural sense.

¶ *Irreligious* is negative; *profane* and *impious* are positive, the latter being much stronger than the former. All men who are not positively actuated by principles of religion are *irreligious*. *Profanity* and *impiety* are, however, of a still more heinous nature; they consist not in the mere absence of regard for religion, but in a positive contempt of it and open outrage against its laws. When applied to things, the term *irreligious* seems to be somewhat more positively opposed to religion: an *irreligious* book is not merely one in which there is no religion, but that also which is detrimental to religion, such as sceptical or licentious writings: the *profane* in this case is not always a term of reproach, but is employed to distinguish what is expressly spiritual in its nature, from that which is temporal: the history of nations is *profane*, as distinguished from the sacred history contained in the Bible. On the other hand, when we speak of a *profane* sentiment, or a *profane* joke, *profane* lips, and the like, the sense is personal and reproachful; *impious* is never applied but to what is personal, and in the worst sense. Ecclesiol. & Ch. Hist.: The followers of the Rev. Edward Irving, who was born at Annan, in Dumfriesshire, on August 15, 1792; in 1819 became assistant to the celebrated Dr. Chalmers, in St. John's Church, Glasgow; in July, 1823, was chosen pastor of a small Scottish Presbyterian congregation in Cross Street, Hatton Garden, and attractiug thither crowds of eminent people, had built for him a fine church in Regent Square, to which he removed in 1829. On October 16, 1831, the gift of speaking in unknown tongues was alleged to have been bestowed upon some people, most of them females, in his congregation, the same phenomenon having arisen on a limited scale before in Glasgow. Irving believed that the miracle recorded in Acts ii. 4–11 had occurred again, and that Pentecostal times had returned. The more sober-minded of his flock and his ministerial brethren thought differently, and were strongly influenced by the consideration that no human being of any nationality recognised the new tongue as his own. Irving's views regarding the human nature of Christ were also deemed erroneous. On May 3, 1832, it was decided that Mr. Irving was unfit to retain the pastorate of Regent Square Church, and on March 15, 1833, the Presbytery of Annan, which had licensed him as a preacher, deposed him from the ministry. He died on December 8, 1834. His followers are often popularly termed Irvingites, but the official designation of the denomination which he founded is the Holy Apostolic Church. They use a liturgy framed in 1842 and enlarged in 1853. They have an altar on which candles are lit, and they burn incense (q.v.). As church officers they have apostles, angels, prophets, &c. In 1851 they had in England thirty chapels. In 1854 one was opened in Gordon Square, London, which is now their leading place of worship.

Script. Hist.: One of the greatest of the Hebrew prophets. He was the son of Amos, whom some of the fathers supposed to be the prophet Amos, the names being identical in Greek; in Hebrew, however, they are different, the prophet being Amos, and Isaiah's father Amots. As in the vision recorded in Isaiah vi., the prophet is represented as being in the court which none but the descendants of Aaron might enter, he was perhaps a priest. He was born probably between B.C. 788 and 783. He married a woman to whom, as to him, prophetic gifts were given (Isa. viii. 3). One of his sons was called Shear-jashub = a remnant returns, or a remnant will return (vii. 3); another Maher-shalal-hash-baz = hasten to the spoil, quickly carry off the prey. Isaiah exerted great influence at the court of Jerusalem under Ahaz, and yet more under Hezekiah. He was contemporary with Amos, Hosea, Micah, and perhaps with Joel. Besides his prophecies, he wrote also biographies or histories of Uzziah (2 Chron. xxvi. 22), and Hezekiah (xxxii. 32). Tradition says that he was sawn asunder by order of King Manasseh, his tragic fate, it is supposed, being alluded to in Heb. xi. 37. [¶]

¶ *The Prophecies of Isaiah:*

Scripture Canon: The first and most important of the prophetic books. It is headed "The vision of Isaiah, the son of Amoz, which he saw concerning Judah and Jerusalem in the days of Uzziah, Jotham, Ahaz, and Hezekiah, Kings of Judah." If chapter vi. is chronologically the earliest of any, and describes his first call to the prophetic office, his utterances would commence in B.C. 758, 757, or 756. If the prophecies are arranged in the order of time, then chapters i.–v. would belong to an earlier period. Omitting these writings of uncertain date, the next utterances are in the reign of Ahaz, none apparently belonging to the sixteen years of Jotham's reign. He continued at least till the fourth year of King Hezekiah, B.C. 712, a period of 44 to 46 years. This is the minimum span of his prophecies; the maximum is much greater.

The book naturally divides itself into three parts: (1) chapters x. to xxxv., the earlier prophecies; (2) ch. xxxvi. to xxxix., an historic appendix or intercalation; and (3) ch. xl. to lxvi. the later prophecies. The standpoint in this third section is that of the Babylonian captivity, and Cyrus, who set the two tribes free, is mentioned by name (xliv. 28, xlv. 1). Hence Koppe (A.D. 1779–1781) supposed a second author, a view adopted by Doderlein, Eichhorn, Justi, Paulus De Wette, Gesenius, Ewald, and nearly all rationalistic critics. On the other hand Hengstenberg, Havernick, Keil, &c., have maintained the integrity of Isaiah. Viewed as a poetic composition the book of Isaiah exhibits genius of a very high order. There are numerous quotations from or references to Isaiah in the New Testament, ch. liii. and other prophecies (vii. 14; ix. 1, 2; liii. 4; lxiii. 1–3) being considered Messianic and applied to Jesus. Hence Jerome considered that Isaiah should rather be called an evangelist than a prophet, and he is not unfrequently called the fifth Evangelist.

Isaiah i. 9 = Rom. ix. 29; vi. 9, 10 = Mat. xiii. 14, 15, Acts xxviii. 25-27; vii. 14 = Mat. i. 22, 23; viii. 14 = Rom. ix. 33; ix. 1, 2 = Mat. iv. 14-16; x. 22 = Rom. ix. 27, 28; xl. 3 = Mat. iii. 3, Mark i. 3; xlii. 1-3 = Mat. xii. 17-20; xliv. 25 = 1 Cor. i. 19, 20; liii. 1. = Rom. x. 16; liii. 4 = Mat. viii. 17; liii. 7-8 = Acts viii. 32-35; lv. 3 = Acts xiii. 34; lvi. 7 = Mat. xxi. 13; lxi. 1-3 = Luke iv. 17-21; lxv. 1, 2 = Rom. x. 20-21; lxv. 17 = 2 Pet. iii. 13; lxvi. 24 = Mark ix. 43-48.

ĭs-ăm'-ĭc, *a.* [Eng., &c. *is(atis); am(monia),* and suff. *-ic.*] (See the compound.)

isamic-acid, *s.*

Chem.: $C_{16}H_{13}N_3O_4$. Imasatic acid. Produced by the action of warm ammonia on isatine. It crystallizes in glistening rhombic plates of the colour of red iodide of mercury, which are slightly soluble in boiling water, forming a bright yellow solution, but very soluble in hot alcohol and in ether. It dissolves in hydrochloric acid with a beautiful violet colour, but is violently attacked by bromine, forming Indelibrome $C_{16}H_8Br_4N_3O_3$. By boiling with dilute acids it is decomposed into ammonia and isatine. Ammonium isamate, $C_{16}H_{12}(NH_4)N_3O_4$, crystallizes in microscopic needles. Potassium isamate, $C_{16}H_{12}KN_3O_4$, is a very stable compound, and may be boiled without decomposing.

ĭs'-ą-tăn, *s.* [Eng., &c. *isat(is); -an.*]

Chem.: $C_{16}H_{12}N_2O_3$. A white compound produced by boiling disulphisatyde with acid ammonium sulphate. It dissolves in boiling alcohol, and deposits on cooling in the form of rectangular crystals. When strongly heated it yields a mixture of isatine and indine. Boiling nitric acid decomposes it, with the formation of a violet powder, somewhat resembling nitrindin.

ĭs'-ą-tāte, *s.* [Eng., &c. *isat(is); -ate* (*Chem.*).]

Chem.: A salt of isatic-acid (q.v.).

ĭ-săt'-ĭc, *a.* [Eng., &c. *isat(is); -ic.*] See the compound.

isatic-acid, *s.*

Chem.: $C_8H_7NO_3 = {}^{\cdot}CO{\cdot}CO{\cdot}OH.$ $C_6H_4{\cdot}NH_2$. By boiling a solution of potassium isatine, it is converted into potassic isatate, $C_8H_6NKO_3$, which, on the addition of plumbic acetate, gives a precipitate of plumbic isatate. When this is suspended in water, decomposed with sulphuretted hydrogen, and the filtrate evaporated in vacuo, a white flocculent deposit of isatic acid or trioxiudol is obtained. Ammonium isatate is capable of existing only in solution. Barium isatate, $C_8H_6BaNO_3$, produced by the action of baryta water on isatine, crystallizes in scales. The silver salt, $C_8H_6AgNO_3$, crystallizes in fine yellow prisms, which are very soluble in water. Isatic acid unites with bromine and chlorine forming bromisatic and chlorisatic acids.

ĭ-săt'-ĭ-dæ, *s. pl.* [Lat. *isat(is);* fem. pl. adj. suff. *-idæ.*]

Bot.: A family of Brassicaceæ, tribo Notorhizeæ.

ĭs'-ą-tĭne, *s.* [Eng., &c. *isatil(s); -ine.*]

Chem.: $C_8H_5NO_2 = C_6H_4{<}^{CO}_{NH}{>}CO$. Obtained by suspending finely powdered indigo in three times its weight of boiling water, and adding gradually nitric acid of sp. gr. 1·35 until the blue colour has disappeared. On cooling, crude isatine is deposited, and may be purified by dissolving in potash, precipitating with hydrochloric acid, and crystallizing from alcohol. It crystallizes in the form of brilliant yellowish-red prisms, which dissolve readily in boiling water, in alcohol, and in ether. It may also be produced synthetically by the action of oxidizing agents on amido-oxindol:

$$C_6H_4{<}^{CH}_{NH}{>}^{\cdot}CO + O = C_6H_4{<}^{CO}_{NH}{>}CO + NH_4Cl,$$

or by the reduction of orthonitro-phenyl glyoxalic acid in alkaline solution:

$$C_6H_4{<}^{CO{\cdot}CO{\cdot}OH}_{NO_2} + 6H = C_6H_4{<}^{CO}_{NH}{>}CO + 3H_2O.$$

Isatine does not unite with acids, but rather plays the part of an acid. It dissolves in potassic hydrate, forming a dark violet-coloured solution of potassium isatine, which, on addition of argentic nitrate, gives carmine-red crystals of argentic isatine, $C_8H_4NO_2Ag$. It also yields crystalline compounds, with alkaline hydric sulphites. Boiling with concentrated nitric acid, it is converted first into nitrosalicylic acid, and finally into trinitro-phenol. When strongly heated, isatine fuses and sublimes in part unchanged.

ĭs'-ą-tĭs, *s.* [Lat. *isatis,* from Gr. ἰσάτις (*isatis*) = a plant, *Isatis tinctoria* (?), producing a dark dye-wood. (Def.)]

ISATIS.

It consists of tall, erect, annual or biennial branched herbs, with equal sepals and one-celled indehiscent pods, oblong, ovate, or orbicular, thickened in the middle, the wing or margin very broad. Species twenty-five to thirty. One, *Isatis tinctoria* (Dyer's Woad) is half wild in Britain. The ancient Britons are said to have stained themselves blue with it. It is still cultivated in Lincolnshire, as *I. indigotica* is in China, for dyeing purposes.

ĭ-są-tō-sŭl-phŭr'-ĭc, *a.* [Eng. *isat(is); o* connective, and Eng. *sulphuric.*] (See the compound.)

isatosulphuric-acid, *s.*

Chem.: $C_8H_5NO_2{\cdot}SO_3$. Prepared by boiling indigo-carmine with sulphuric acid, and decolorising by means of acid chromate of potassium. On adding nitrate of potassium to the hot filtered solution, potassium isatosulphate is deposited in the form of a brownish-yellow sandy powder. By dissolving this powder in hot baryta water, and decomposing the barium salt formed, with an equivalent quantity of sulphuric acid, isatosulphuric acid is obtained in the free state. It is a strong acid, separating even some of the mineral acids from their salts. When evaporated in vacuo, it yields a yellow, silky, crystalline mass, which does not alter on exposure to the air. It is soluble in water, slightly soluble in alcohol, but insoluble in ether and in benzene. It forms two classes of salts, monobasic and dibasic, the former of which are very stable compounds, retaining their water of crystallization till heated above 100°.

isethionic-acid, *s.*

$$CH_2{\cdot}OH$$

Chem.: $C_2H_6SO_4 = |$

$$CH_2{\cdot}SO_2{\cdot}OH$$

This acid, which is isomeric with sulphovinic acid, was discovered by Magnus in 1833. It is obtained most readily by adding sulphuric anhydride to anhydrous ether, cooled by a mixture of ice and salt. The resultiug thick, oily liquid is diluted with water, boiled for several hours in order to decompose the ethionic acid, and then saturated with baric carbonate. The liquid, filtered at the boiling point, yields, first crystals of baric methionate, and afterwards, on further evaporation, baric isethionate ($HO{\cdot}CH_2{\cdot}CH_2{\cdot}SO_2{\cdot}O)_2Ba$. On decomposing the baric salt with sulphuric acid, and evaporating the filtrate, isethionic acid is obtained in the form of deliquescent needles. The isethionates, which can be prepared by decomposing the baric salt with solutions of the respective metallic sulphates, are all soluble in water, and slightly soluble in alcohol. They crystallize well, and in many cases can be heated to 350° without decomposition. Ammonium isethionate, $C_2H_5(NH_4)SO_4$, crystallizes in well-defined octahedrons, which do not lose weight at 120° Potassic isethionate, $C_2H_5K{\cdot}SO_4$, forms rhomhoidal prisms, which melt between 300° and 350°. The copper salt, $C_2H_5Cu{\cdot}SO_4$, forms pale-green prisms with rhombic base; at 140° to 150° it turns white, and gives off twenty per cent. of water of crystallization.

Chem.: $C_6H_{10}O_6$. An acid isomeric with diglycol-ethylenic acid, prepared by heating to 100°, in a strong vessel, a solution of milk-sugar and bromine, and neutralising the product with moist oxide of silver. It is soluble in water and in alcohol, and from the latter it is precipitated by ether in flocks. The aqueous solution gives no precipitate with neutral or basic acetate of lead. It melts at 98°, and at a higher temperature chars, giving off the odour of burnt sugar. Ammonium isodiglycol-ethylenate, $C_6H_9(NH_4)O_6\cdot H_2O$, crystallizes in large transparent crystals, soluble in water, but insoluble in alcohol. The calcium salt crystallizes in large shining plates. The barium, strontium, and silver salts are gelatinous and easily decomposed. Chem.: An isomeric body.

ī-sŏm'-ĕr-ĭsm, *s.* [Gr. *ισομερής* (*isomerēs*), and Eng. suff. *-ism.*] [ISOMERIC.]

Chem.: A term applied to those bodies which are composed of the same elements, in the same proportions, but which differ either in their physical characteristics, or in their chemical properties. They may be divided into three distinct classes: isomeric, metameric, and polymeric bodies.

Isomeric bodies or isomerides are those which show analogous decompositions and changes, when heated, or when treated with reagents, but differ in physical properties. The terpenes, $C_{10}H_{16}$, constitute the chief ingredients in the essential oils of turpentine, lemon, orange, juniper, &c. They have the same composition, and resemble each other closely in their chemical actions, but they differ in odour, boiling point, and their action on polarised light. They are true isomers, in the strict sense of the word.

Metameric bodies, or metamerides, are those which exhibit dissimilar transformations when heated, or when acted on by reagents. The molecular formula, $C_3H_6O_2$, represents the three compounds, propionic acid, ethyl formate, and methyl acetate. Propionic acid, a crystalline body, is converted by potash into potassium propionate; ethyl formate, a colourless, aromatic liquid, boiling at 56°, is resolved by potash into ethylic alcohol and potassium formate; whilst methyl acetate, a colourless, volatile liquid, is decomposed by potash into wood spirit (methylic alcohol) and an acetate. These three compounds, which are composed of the same elements in the same proportions, differ in the nature of their products when acted on by reagents, and are said to be metameric with one another.

Polymeric bodies, or polymerides, contain the same elements in the same proportions, but have different molecular weights. The most striking example is exhibited by the hydrocarbons, all of which are multiples of the lowest, namely, methene, CH_2, which, however, is not known in the free state. Thus we have ethylene, C_2H_4, propylene, C_3H_6, butylene, C_4H_8, amylene, C_5H_{10}, all of which possess the same per centage composition, but different molecular weights. All polymerides exhibit regular gradations of boiling points, and vapour densities.

Isometrical perspective, *s.* A method of perspective drawing which allows of buildings being represented with base lines at any angle of view, but without the other lines of any side of such building converging, as they do in ordinary perspective, to a vanishing point. It is generally adopted for birds'-eye views of extensive buildings, which thus combine the advantages of a ground plan and elevation.

ī-sō-mor'-phĭsm, *s.* [Pref. *iso-*; Gr. *μορφή* (*morphē*) = form, shape, and suff. *-ism.*]

Min.: A general law, discovered in 1819 by Professor Mitscherlich, of Berlin, by which the variation of minerals is governed. It is that the ingredients of any single species of mineral are not absolutely fixed as to their kind and quality, but one ingredient may be replaced by an equivalent portion of some analogous ingredient. Thus in augite the lime may be in part replaced by portions of peroxide of iron, or of manganese, while the form of the crystal and the angle of the cleavage plane remains the same. These substitutions are, however, confined within certain limits. (*Lyell*, &c.)

ī-sō-mor'-phoŭs, *a.* [Pref. *iso-*, and Gr. *μορφή* (*morphe*) = a form, and Eng. suff. *-ous.*]

Chem.: A term applied to certain substances, which have the same crystalline form, and are also analogous in their chemical constitution. The alums, for instance, no matter what their composition, all crystallize in octahedra, and if we place a crystal of potassium alum in a solution of chrome-alum, the crystal will continue to increase with perfect regularity from the deposition of the latter salt. "Bodies having apparently an exactly similar constitution are not necessarily isomorphous, but are rather divisible into two or more groups, of which the respective members are isomorphons; on the other hand, the possession of an equal number of atoms is not essential to isomorphism, for two atoms of one element are not unfrequently isomorphous with one atom of another element; and sometimes a molecular group is isomorphous in its combinations with an elementary atom—NH_4 with K, for example. There are also numerous examples of bodies crystallizing in the same form, but without exhibiting any similarity of chemical constitution." Isomorphous bodies are generally arranged according to the crystallographic systems. The elements belong to the monometric system, with the exception of arsenic, antimony, and bismuth, which belong to the hexagonal. The protoxides, the proto-chlorides, bromides, and iodides, and the proto-sulphides are also monometric. The carbonates belong partly to the trimetric, and partly to the hexagonal, the nitrates to the hexagonal and the monometric, and the alums to the monoclinic systems. When the same body is found to crystallize in two different forms, it is said to be dimorphous. (CRYSTALLOGRAPHY, CRYSTALS.]

The form of such demurrer is by averring the declaration or plea, the replication or rejoinder, to be bad in substance, that is, insufficient in law to maintain the action or the defence; and the party demurring is thereupon understood to pray judgment for want of sufficient matter alleged. Upon a demurrer, the opposite party must aver his pleading to be good in substance, which is called a joinder in demurrer, and then the parties are at *issue* in point of law. And when he that denies or traverses the fact pleaded by his antagonist has tendered the *issue*, the other party may immediately join *issue*; or if affirmative matter be set out in the pleading, he may at once take *issue* thereon. Which done, the *issue* is said to be joined, both parties having agreed to rest the fate of the cause upon the truth of the fact in question. It crystallizes in long, deliquescent needles, which are soluble in alcohol and ether, and melt between 60° and 65°. -īte, *suff.* [Lat. *-ites;* Gr. *-ιτης* (*-ītēs*). (See def.)]

I. *Ordinary Language:*

1. *As an adjectival suffix:* Of or belonging to, as Danite.

2. *As a substantival suffix:* One belonging to: as, an Israelite, a man belonging to the people of Israel.

II. *Technically:*

1. *Chem.:* A suffix used in chemical terms in the naming of salts. When the name of the acid terminates in *-ous,* the name of the salt ends in *-ite,* and the word thus formed is connected by *of* with the name of the base combined with the acid. Thus from sulphur*ous* acid come sulph*ites:* as, sulph*ite* of sodium, sulph*ite* of barium, &c.

2. *Min.:* A mineral. Remotely it was derived from the Gr. *-ιτης* (*-ītēs*), which is an adjectival termination = of or belonging to, and required *λίθος* (*lithos*) added, before the meaning stone was supplied. Thus *πυρίτης* (*puritēs*) is = of or on fire, and *πυρίτης λίθος* (*puritēs lithos*), fire-stone, not simply *πυρίτης* (*puritēs*), is the mineral which strikes fire, as copper or other pyrites. When the Greek word was transferred to Latin, *λίθος* (*lithos*) = stone, was dropped, and pyrites is used by Pliny for (1) flint, (2) a mill-stone, and (3) iron pyrites, sulphuret of iron. Mineralogists taking the word from Pliny's Latin, and not from Greek, now attach to *-ite* the signification stone or mineral.

3. *Palæont. & Palæo-bot.:* Fossil. Used as the English equivalent of *-ites* in the termination of many genera; as ammon*ite,* the English equivalent of *ammonites;* belemnite, of *belemnites;* Nipadites, of *Nipa.*

4. *Petrol.:* Formerly *-ite* was used also for rock, but Dana, for discrimination's sake, altered it to *-yte.* Some still use *-ite* in place of *-yte.*

In the principal modern languages John, or its equivalent, is a common name of contempt, or slight. Thus the Italians use *Gianni*, whence *Zani;* the Spaniards, *Juan*, as *bobo Juan* = a foolish John = the French *Jean*, &c. Hence in English we have *Jack-fool, Jack-an-apes, Jack-pudding*, and perhaps *Jackass.* A *Jack o' the clock* (*Shakesp.: Richard II.*, v. 5) was a figure which, in old clocks, struck the hours upon the bell: hence the word *Jack* came to be applied to various implements, which supplied the place of a boy or attendant, as the *jack* which turns the spit in a kitchen, a *boot-jack*, &c. Still more generally it is applied to a large variety of implements or instruments which are used in the place of another hand or of an assistant, and in this way is frequently compounded with other words, the associated word expressing either its purpose, structure, or relation, as *jack-screw, jack-frame, rail-jack*, &c.]

All who have lived in the East must have heard its unearthly yells suddenly breaking in upon the silence of night. It hunts in packs. It is not, consciously at least, the "lion's provider." It is not generally on living animals that it feeds, but on carrion. It is, therefore, improbable that, as a rule, a troop of jackals hunts down prey, and then the lion, presenting himself, takes it from them. There are fine ones on Mount Abu, a granitic mountain 5,000 or 6,000 feet high, in the same province. One temple there is of date between A.D. 1197 and 1247, another about A.D. 1032. In Jain architecture there is generally a horizontal dome supported by eight leading pillars, with other less important ones, the whole number in some cases amounting to fifty-six. There are cells as in Booddhist monasteries; they are occupied, however, not by monks, but by the cross-legged images of the Tirthankars, to whom it is dedicated. There is elaborate ornamentation; the temples are surrounded by porticos. Some Jain temples have been converted into mosques. (*Fergusson*, &c.)

Jaĭn'-ĭsm, *s.* [Goozerathee, &c., *Jain*, from Sansc. *jina* = victor over all human passions and infirmities; suff. *-ism.*]

Religions: An Indian faith, most closely akin to Booddhism (q.v.). The Jains, like the Booddhists, disregard the authority of the Vedas. Like them, they give high adoration to mortal beings; but while the Booddhists practically confine their worship to seven Booddhas, the Jains nominally recognize seventy-two—viz., twenty-four for the past age, twenty-four for the present one, and twenty-four for the future. These are called Tirthankars or Tirthakars—persons who have crossed over (*tiryata anena*)—*i.e.*, the world compared to the ocean. They are then deified, and divine qualities are predicated of them in their present state. They are called supreme lords and gods of gods. Practically speaking, worship is confined to two of the Tirthankars, Parsanath and Mahavira. The latter is said to have been the preceptor and friend of Booddha. This would look as if the Jaina faith had preceded Booddhism, but the period of its greatest glory was the eleventh or twelfth century of the Christian era, just after Booddhism had been driven from India. Fergusson thinks that it actually existed prior to the rise of Booddhism, and that when the latter system fell, perishing under the weight of its immense priesthood and its legions of monks, an effort was made by its friends to revive the old faith. But modern Hindooism was shooting up so vigorously, that its existence could not be ignored. Jainism was obliged to derive various tenets and practices from it, so that it became rather a degenerate than a reformed Booddhism.

ja-lăp'-ĭc, *a.* [Eng. *jalap(ine); -ic.*] Derived from or in any way connected with jalapine (q.v.).

jalapic-acid, *s.*

Chem.: $C_{34}H_{58}O_{17}$. A tribasic acid obtained by boiling jalapine with baryta-water, and, after accurately precipitating the barium with sulphuric-acid, evaporating the filtrate to dryness. It is an amorphous, yellowish, brittle mass, melting a little above 100°, very soluble in water and in alcohol, less so in ether. It is odourless, but possesses an unpleasant, bitter taste. When heated on platinum foil to 130°, it decomposes, burning with a bright, sooty flame. Jalapic-acid unites with bases forming salts, in which one, two, and three atoms of hydrogen are replaced by the same number of atoms of the metals. The jalapates are all amorphous. When an aqueous solution of jalapic-acid is boiled with dilute sulphuric-acid, a brown semi-crystalline mass is formed. By boiling this mass with baryta-water, and filtering when cold, alpha jalapic-acid is formed in the mother liquor. It crystallizes in white, flexible needles, which melt at 78° to a pale yellow oil. It is soluble in alcohol and in ether, and slightly soluble in water.

jăl'-ą-pĭn, jăl'-ą-pĭne, *s.* [Eng., &c. *jalap*; suff. *-in, -ine* (*Chem.*) (q.v.).]

1. *Chem.:* An amorphous glucoside existing, together with convolvuline, in the tubers of officinal jalap root. In order to prepare it, the jalap root must be several times extracted with water, and then with alcohol, the colour removed by animal charcoal, and the filtrate evaporated to dryness on a water-bath. The residue is then dissolved in alcohol, filtered, and the glucoside precipitated by means of ether. When pure, it is a colourless, odourless, tasteless, amorphous mass, very soluble in alcohol and dilute acids, slightly soluble in water, but insoluble in ether. It dissolves readily in the fixed alkalis, and is not reprecipitated by acids, having been converted into amorphous convolvulic-acid, which is soluble in water. When heated to 100°, it becomes brittle, and may be rubbed down to a white powder. It softens at 123°, and melts at 150° to a pale yellow syrup. At a higher temperature it takes fire, and burns with a sooty flame, emitting a pungent, empyreumatic odour. When dissolved in strong sulphuric-acid, the solution acquires a beautiful purple colour, which changes to a brown, and finally to a jet black.

2. *Comm.:* The jalapin of the shops is the resin of jalap, extracted by spirit from the tubers, and afterwards precipitated by water.

jăl-ą-pĭn-ŏl', *s.* [Eng. *jalapin*, and *ol(ein).*]

Chem.: $2C_{16}H_{30}O_3,H_2O$. A white crystalline body, prepared by adding fuming hydrochloric acid to a concentrated, aqueous solution of jalapic-acid, and leaving it to itself till the mixture has solidified to a thick crystalline mass. On washing the product on a filter with cold water, and recrystallizing several times from alcohol, pure jalapinol is obtained. It is inodorous, feels fatty to the touch, melts at 62°, and solidifies at 59° to a hard, brittle, crystalline mass. It is insoluble in water, but soluble in alcohol and in ether.

jăl-ą-pĭn'-ō-lāte, *s.* [Eng. *jalapinol; -ate.*]

Chem.: $C_{16}H_{32}O_3$. A monobasic acid produced by treating jalapinol with caustic alkalis, or by heating gradually a mixture of jalapin and sodium hydrate, and decomposing the sodium jalapinolate by means of hot acidulated water. On cooling, jalapinolic-acid separates in the solid form. It is inodorous, but has an irritating taste, insoluble in water, but soluble in alcohol and in ether. It crystallizes from alcohol in the form of white tufts of needles. It melts at 65°, and solidifies at 62° to a white, crystalline, brittle mass. At a higher temperature it decomposes, emitting a pungent odour, which attacks the eyes and throat. It forms salts called jalapinolates.

Jāmeş, *s.* [Fr. *Jame, Jacques*; Lat. *Jacobus*; Gr. Ἰάκωβος (*Iakōbos*); Heb. יַעֲקֹב (*Iaaqob*) = Jacob (q.v.).]

Scrip. Hist.: The name certainly of two, and possibly of three, persons mentioned in the New Testament.

1. James, the son of Zebedee, and the brother of the apostle John, himself also being an apostle (Matt. iv. 21, 22, x. 2, xvii. 1; Mark i. 19, 20, iii. 17, ix. 2, xiii. 3, xiv. 33; Luke vi. 14; Acts i. 13). He was martyred under Herod Agrippa I., A.D. 44 (Acts xii. 2).

2. James, the son of Alphæus, also an apostle (Matt. x. 3; Mark iii. 18; Luke vi. 15; Acts i. 13). It has been greatly debated whether James, "the Lord's brother," mentioned in Gal. i. 19, was the same with the son of Alphæus. If in this passage the word "apostle" is used in its usual technical sense, they are clearly identified, for there were only two Jameses apostles. If used in a loose sense, they may have been different. A James, probably the same one, "seemed to be" a "pillar," like Cephas and John (Gal. ii. 9). This James apparently had strong Jewish proclivities, finding fault with those Jewish Christians who ate with Gentile converts (Gal. ii. 12). It was probably he who presided over the Council of Jerusalem mentioned in Acts xv., and he seems to have had apostolic charge of the mother church at that city (Acts xii. 17, xv. 13, xxi. 18). He was called "the Less," either from being younger than James the son of Zebedee, or from being shorter than he in stature (Mark xv. 40). [1.] His mother's name was Mary (Matt. xxvii. 56; Mark xv. 40; Luke xxiv. 10), and he was brother to Jude or Judas (Mark vi. 3; Jude 1).

¶ *Epistle of St. James:*

New Testament Canon: The first of the catholic or general epistles. The apostle James, the son of Zebedee, died too early to have been its author. [JAMES, 1.] It was penned by either James, the son of Alphæus, or James, the brother of our Lord, if the two were different; by the apostle who bore both designations if they were the same. It was addressed to the twelve tribes scattered abroad—*i.e.*, to the Jewish converts to Christianity beyond the limits of Palestine. Its teaching is in disconnected portions, and treats more of conduct than of belief, though the indispensableness of faith to efficacious prayer is strongly insisted on (i. 6). Portions of it look antagonistic to the teaching of St. Paul (cf. Rom. iii. 28 with James ii. 21, 25), and most rationalists believe that the antagonism is real. But faith is used in a different sense in James from that which it obtains in the Pauline writings. What Paul calls simply "faith," James would term a living faith, and it is not against it but against a dead faith that he contends (ii. 17). The epistle was written probably at Jerusalem. Its date is uncertain. It has been fixed in A.D. 44 or 45, in A.D. 60, in A.D. 62, and not till the second century. Clement of Rome seems to have referred to it, and perhaps Hermas. Origen expressly mentions it as the epistle ascribed to St. James (*Comment.* on John, tom. xix.). It figures in the Syrian Version of the New Testament. It was ranked by Eusebius among his Antilogoumena. In A.D. 397 the Council of Carthage placed it in the canon. Though Luther spoke disrespectfully of it, yet it is now generally accepted as a portion of Divine Scripture.

Church History:

1. The tenet of a sect or party in the Roman Church, named after Cornelius Jansenius, bishop of Ypres in the Netherlands, who died A.D. 1640. After his decease a work of his was published, called *Augustinus*, in which Jansenius stated and explained the views of St. Augustine, mostly in that Christian father's own words. At the instigation of the Jesuits, the Inquisition at Rome, in 1641, prohibited the work from being read, and, in 1642, Pope Urban VIII. pronounced it to be contaminated with several long condemned errors. The doctors of Louvain took the part of Jansenius, gaining many adherents to their views. John du Verger de Hauranne, abbot of St. Cyran or Siegeran, who was believed to have aided Jansenius in compiling the *Augustinus*, introduced the system into France. On May 31, 1653, Pope Inuocent X. declared four out of five propositions extracted from Jansenius's work heretical, and a fifth, rash, irreligious, and injurious to God. The celebrated jurist, Anthony Arnauld, accepting the principal statement that the views were censurable, maintained that they were not in Jansenius, nor had the Pope stated expressly that they were, on which, on Oct. 16, 1656, Pope Alexander VII. declared that the condemned propositions were those of Jansenius. The other party were then driven to asserting that the Pope might err as to a matter of fact though not in one of doctrine, especially when unaided by a general Council; while the Jesuits, on the other side, maintained his infallibility both with regard to facts and doctrinal opinions. The Jesuits had accommodated their system to the views of courtiers and men of the world, among whom their strength lay; the Jansenists evoked the enthusiasm of the common people by manifestations of piety and devotedness. There was in a deep and narrow valley near Paris a nunnery, called Port Royal in the Fields. Its first abbess was Jacqueline, one of the daughters of Anthony Arnauld who afterwards bore the name of Maria Angelica de S. Magdalena. Its inmates were enthusiastic supporters of Jansenism. Jansenist penitents, of both sexes, built for themselves cottages without the precincts of the cloister. Some were able men, and the authors of Port Royal became celebrated. One was Blaise Pascal. In 1709, Louis XIV., at the instigation of the Jesuits, ordered the nunnery to be demolished, and two years later had the bodies buried there disinterred, and reburied in other places. In 1698, Father Quesnel, then the head of the Jansenist party, published a work called *Moral Observations on the New Testament.* Against this production Pope Clement XI. in 1713 fulminated the Bull *Unigenitus*, and those who did not accept it were cruelly treated. This drove them to fanaticism instead of crushing their spirit. Miracles were said to have been wrought again and again in vindication of the Jansenist doctrines. Convulsionaries and Flagellants sprang up. The Jansenist troubles continued more than a century, and even yet there are Jansenist churches in Holland at Utrecht and Haarlem.

"Perhaps the best description of *Jansenism* is that it was a professed attempt to restore the ancient doctrine and discipline of the Church."—*Addis & Arnold's Cath. Dict.*, p. 464.

2. An opinion or utterance characteristic of Jansenist teaching.

Ja-pan', *v.t.* [JAPAN, *s.*]

1. To coat wood, metal, or paper with a thick coat of hard brilliant varnish. Japanning involves the baking of the varnished article. The Japanese employ a lacquer obtained from a tree (*Rhus vernix*) by making incisions in the trunk and collecting the juice; this is at first like cream, but becomes black by exposure to the air. Their process is said to be as follows: After the juice has assumed a deep black colour, finely pulverized charcoal is added to it. The lacquer is applied to an article in several successive coats, each being dried in the sun before the next is put on. It soon becomes extremely hard, and is polished with a smooth stone and water until it becomes as smooth as glass. On this surface ornaments and figures are traced with a brush dipped in a varnish of boiled oil and turpentine. Before this is quite dry, gold or silver leaf is laid on, and the whole afterwards receives a finishing coat of varnish.

Length about thirteen inches. It is a beautiful bird, but attacks peas and other garden crops, to which it is very destructive, especially in the vicinity of woods and forests. It also eats worms, larvæ, and snails. It is often kept as a cage-bird. The common blue jay, *Cyanocitta cristata*, is found over a large part of North America. The Green Jay of America is *Xanthura luxuosa*. The long-tailed blue jays are also arranged under Xanthura, though they have not the yellow tail which the generic name suggests.

It was formed by overlapping pieces of steel, fastened by one edge upon canvas, which was coated over with velvet or cloth; it was, in fact, a method of quilting or padding a dress with metal internally, to make it sword and dagger proof, without being visible to the eye. The pieces of metal were generally small, and allowed flexibility, by being fastened down by one side only. The jazeraut was much worn by Italian nobles during the troublous period of the middle ages. It was also worn by the peasantry of the English border as a defence in their skirmishes with the mosstroopers.

Scrip.: The most sacred of the names given in the Old Testament to the Supreme Being, regarded also as the God specially of the Jewish people. So holy was the name deemed that the Jews were afraid to allow it to escape their lips, and therefore took means intentionally to mispronounce it by altering its vowel points to those of Adonai, or, when the two occur together, of Elohim, less sacred names for God. This superstitious practice arose from their having misinterpreted such passages as Deut. xxviii. 58; Lev. xxiv. 11, 15, 16; Exod. xx. 7. What the real vowel points, and consequently the proper pronunciation, should be is now doubtful. Many critics contend for יְהֹוִה (*Yahveh*), some for יַהְוֶה (*Yahvah*), and some for יַהֲוֶה (*Yahavoh*), &c. It is generally derived from הָוָה (*havah*), an old form of הָיָה (*haiah*) = He is. The import of the name is explained in Exod. iii. 14, "I am that I am," or "I am," thus predicating self-existence or existence in a sense in which it can be applied to no created being. In Exod. vi. 3 we read that God appeared to Abraham, Isaac, and Jacob, by the name of God Almighty, but was not known to them by the name Jehovah. The meaning may

have been that the patriarchs did not properly realize the depth of meaning in the name, for the word occurs in Gen. xiv. 22, xxvi. 22, xxviii. 16. Elohim stands for God as the creator and ruler of the universe (Gen. i. 1); Jehovah as a being standing in the most intimate relation to the Jewish people as their theocratic ruler and God (Psalm cxxxv. 4), as supreme above all gods (verse 5), the First and the Last (Isa. xli. 4), nay the only true God (xliv. 5, 8). In studying these passages, be it observed that where there is the word Jehovah our translators have spelled Lord with capital letters. It has been suggested that the name Jehovah was of Phœnician origin, and that it made way among the Israelites slowly to the age of Samuel, and then with greater rapidity. Movers connects it with the Phœnician *Iao* = the Sun-god in the several seasons, and especially in autumn, as well as with the Chaldean *Iao* = the Intelligent light.

Script. Biography: The name of eight men mentioned in the Old Testament, the only very notable one being Jeremiah the prophet. He was of priestly descent, and born or resident at Anathoth, about three miles N.N.E. from Jerusalem. His father's name was Hilkiah. When called to the prophetic office, in the thirteenth year of King Josiah, B.C. 629 or 625, he calls himself a child. His prophetic life spanned the eleventh of King Zedekiah, about B.C. 588, a period of thirty-seven or forty-one years. Of intense nervous sensibility, gentle, and compassionate, he seemed more naturally adapted for retirement and contemplation than for an active life, yet under the constraining sense of duty he faced hostile kings, nobles, or common people, suffered imprisonment more than once, and was at times in imminent danger of death. At that time Judah found itself between two powerful kingdoms, Babylon on the east and Egypt on the south. Josiah espoused the Babylonian alliance, and lost his life fighting against the Egyptians. Jeremiah also was

on the Babylonian side, and, when Jerusalem was taken by Nebuchadnezzar, Jeremiah was treated with kindness by the conqueror, being offered the option of an honourable position in Babylon or permission to remain in his own land. Jeremiah elected to stay, and found Gedaliah appointed ruler by the Chaldeans. On the murder of that governor the assassins and their sympathisers fled to Egypt, taking Jeremiah with them. Tradition says that he was put to death in Egypt for preaching against idolatry. He wrote two Old Testament books, the prophecies of Jeremiah and the Lamentations. Many rationalistic critics attribute to him also the book of Deuteronomy.

¶ *The Prophecies of Jeremiah:*

Script. Canon: One of the Canonical books of the Old Testament, the second of the greater prophets. The several predictions are not in chronological order, though it is believed by some critics that an arrangement of another character is discernible. A certain plaintive air runs through the book, deepening as the trials of the seer increase. There is not the same energy or rhythm as in Isaiah. There are resemblances in the language to that of Deuteronomy—Aramaic expressions abound in the work. The concluding chapter, an historical one, is evidently from another hand—the Hebrew and Septuagint differ considerably. Jeremiah xxxi. 15 is quoted in the New Testament in Matt. ii. 18, and Jer. xxxi. 31–34 in Heb. viii. 8–12. The quotation from Jeremy the prophet in Matt. xxvii. 9 is now found only in Zech. xi. 12, 13.

It is decidedly acid, and forms crystallizable salts, containing four equivalents of metal.

jĕr'-vĭn, jĕr'-vĭne, *s.* [Sp. *jerv(a)* = the poison of *Veratrum album; -in, -ine* (*Chem.*).]

Chem.: $C_{30}H_{46}N_2O_3{\cdot}2H_2O$. An alkaloid discovered by E. Simon in the root of white hellebore (*Veratrum album*), in which it exists together with veratrine. To obtain it, the alcoholic extract of the powdered root is mixed with dilute hydrochloric acid, and sodium carbouate added. The resulting precipitate is separated by filtration, dissolved in alcohol, decolorised with charcoal, and the alcohol removed by distillation. The solid residue obtained is a mixture of jervine and veratrine, the latter being uncrystallizable, may be entirely removed by submitting it to pressure; or the residue may be treated with dilute sulphuric acid, which takes up the veratrine sulphate, and leaves the jervine sulphate. When pure, it is colourless, odourless, and tasteless, insoluble in water, readily soluble in alcohol, and sparingly so in ammonia. Its most characteristic reaction is said to be with strong sulphuric acid, which colours it first yellow, then green. With acids it yields salts which are all very soluble.

Jĕs'-ụ-āte, *s.* [Eng. *Jesu(s); -ate;* Fr. *Jésuate.* So called from the frequency with which the order pronounced the name of Jesus.]

Church Hist. (*Pl.*): A name ultimately given to a monastic order, which, when first founded in 1368, was called Apostolic Clerks (q.v.).

Jĕs'-ụ-ĭt, *s.* [Eng. *Jesu(s); suff. -it;* Fr. *Jésuite.*]

1. *Ch. Hist.* (*Pl.*): The Society of Jesus, the most celebrated ecclesiastical order of modern times. The great religious revolution of the sixteenth century ran through the three stages which tend to occur in revolutions in general. First there was a moderate departure from the previously existing state of things; then the Anabaptists burst loose from control, and went into extravagances and excesses. [ANABAPTISTS.] Reaction then became inevitable, and if a suitable leader should arise was bound to become powerful. That leader was found in Don Inigo Lopez de Recalde, generally known from the castle of Loyola where he was born, in 1491, as Ignatius Loyola. He became an officer of great bravery in the army, though he was not above the ordinary military vices. Dreadfully wounded in 1521 while defending Pampeluna against the French, and long confined in consequence to a sick bed, he saw the vanity of the world, and, renouncing it, resolved in future on a devotedly religious life. When, on his recovery, he was at the University of Paris, he made converts of two fellow students who lodged with him, one a youth of aristocratic descent, Francis Xavier, afterwards the Apostle of the Indies. In 1534 he and they, with four others, seven in all, formed a kind of religious society, the members of which preached through the country. On August 15 of that year they took vows of chastity, absolute poverty, devotion to the care of Christians, and to the conversion of infidels. This was the germ of the Jesuit order. Loyola, like most other Spaniards of aristocratic descent, was devotedly attached to the old order of things, rudely shaken by the Reformation. A soldier, he bethought him of an army in which inferiors should give implicit obedience to their superiors. A general should command, and should have none above him but the Pope, to whom he should give loyal support. Paul III. issued a bull in 1540 sanctioning the establishment of the order with certain restrictions, swept away three years later. In 1542 Loyola was chosen general of the order, and afterwards resided generally at Rome. His followers went everywhere giving special attention to the education of youth, the instruction of adults by preaching, the defence of Catholicism against heretics and unbelievers, and the conversion of the heathen and Muhammadans. His order spread with great rapidity, and at the death of Loyola on July 31, 1556, consisted of above 1,000 persons, with 100 houses divided into twelve provinces. The Jesuits rendered great service to the Papacy, but ultimately became unpopular with the civil government in most Roman Catholic countries. The people thought them crafty. [See the derivative words which follow.] In September, 1759, an order was given for the expulsion of the Jesuits from Portugal and Brazil. In 1764 the order was suppressed in France, and its property confiscated. On March 31, 1767, similar destruction overtook it in Spain, and soon after in Spanish America, and next, after 1768, in the Two Sicilies and Parma, till at length on July 21, 1773, the Pope issued a bull suppressing the order altogether. Austria and the other Roman Catholic states obeyed the decree. In August 1814 Pope Pius VII. re-established it. In June, 1817, the Jesuits were expelled from Russia, and the British Roman Catholic Emancipation Act, 10 Geo. IV. c. 7, passed in 1829, left them under some disabilities, which have since been removed. Recently expelled from France, many of them have sought an asylum in England, successfully claiming that religious liberty which is considered the right of all religious organizations.

1. *Scrip. Hist.:* Joshua (Acts vii. 45; Heb. iv. 8).

2. *Scrip. Hist. & Theol.:* The name miraculously given to the first-born son of the Virgin Mary conceived by the Holy Ghost. An angel who appeared to Joseph, Mary's betrothed lover, directed that that son on his birth should be called Jesus, "for he shall save his people from their sins." Some persons suppose that when Christ is superadded, Jesus is analogous to what now would be called the Christian name, while Christ is the surname. This view is erroneous. The only personal name is Jesus, and Christ is the designation of office or mission, indicating that the being who bore it claimed to be the Messiah promised to the fathers. [CHRIST, MESSIAH.] Nearly all the Churches of the world, the Unitarian one being the chief exception, recognize a divine and a human nature in Christ, regarding him with respect to the former as the Second Person of the Trinity and the Son of God; with regard to the latter, as the perfect type of humanity, the only sinless man that has lived on earth. [For details regarding his birth at Bethlehem, the flight of Joseph and Mary, taking him with them into Egypt, the return to Palestine, the boyhood and early manhood spent at Nazareth, his itinerant ministry—believed, chiefly on chronological data supplied in St. John's Gospel, to have lasted about three years, see the Four Gospels. For the significancy of his death, see ATONEMENT. For his resurrection and ascension, see these words.] The birth of the Saviour is generally believed to have been in B.C. 4, the commencement

of his ministry A.D. 26, and his crucifixion A.D. 29.

The extortions to which the Jews were subject in the Middle Ages, and the cruel mutilations to which they were exposed if they refused to pay the sums demanded of them, probably gave rise to this expression. There is a well-known story that King John demanded 10,000 marks from a Jew of Bristol, and ordered one of his teeth to be drawn every day, till, having lost seven teeth at the hands of a none too gentle dentist, the unfortunate Jew paid the required amount. The *Slang Dictionary* says "Probably a corruption of Ital. *gioje;* Fr. *joaille* = a jewel." Collier notes that in the older editions this expression is printed "Jewes eye," and says it may be a question whether Shakespeare did not mean that Launcelot should merely repeat the phrase, leaving "Jewes" to be pronounced as a disyllable." The corrected folio (1632), alters the expression to—

Cf. *Notes & Queries,* June 21, 1884, p. 489.] To chide sternly; to reprimand, to scold.

Jōb, *s.* [Heb. אִיּוֹב (*Iyob*); Gr. Ἰώβ (*Iōb*) = a patriarch notable for his patience.] [¶]

¶ *The Book of Job:*

Old Test. Canon: In the English version of the Bible, Job stands first in order of the poetic books of the Old Testament, but it is the third in the Hebrew Scripture, Psalms and Proverbs preceding it, and the Song of Solomon coming next. A prologue (ch. i. ii.) and the conclusion (ch. xlii. 7-17), are in prose. The rest is poetry, and of a very high order. In the historical prologue Job is introduced as deeply pious and exceedingly prosperous. Satan insinuates that he is pious simply because God has bribed him to be so by means of his prosperity. Remove the latter, and the former will also depart. Instead of blessing, he will curse God to his face. To prove the falsity of this charge, Satan is allowed to strip Job of possessions and children, and to afflict him with a loathsome disease. The patriarch bows uncomplainingly to the Divine decision, while the piety of his wife breaks down in the trial. Job's three friends—Eliphaz, Bildad, and Zophar—arrive to comfort him, and the poetry begins. Job, in despair, curses the day of his birth; Eliphaz replies, and Job makes a rejoinder. Bildad follows, and Job answers him. Zophar next speaks, and Job again replies (ch. iii.-xiv.). Each of the three friends speaks anew, Job thrice replying (xv.-xxi.). Then follow Eliphaz and Job, Bildad and Job, Zophar remaining silent. A fourth speaker, a young man, Elihu, dissatisfied with the reply of the elder three, feels vehemently moved to put in his word, and does so (xxxii.-xxxvii.). All the four proceed on the erroneous notion that whoever suffers more than others must have previously sinned more grievously than they (Luke xiii. 1-5). They infer that Job must have done so, Job, on his part, having long since been provoked to exclaim, "Miserable comforters are ye all!" (xvi. 2). [JOB'S COMFORTER.] Jehovah then answers the patriarch out of the whirlwind, and vindicates his conduct and views, Job answering in deepest abasement (xxxviii.-xlii. 6). The comforters are censured, are enjoined to offer sacrifice, and are pardoned on the intercession of Job, to whom are born exactly the same number of children he had lost (cf. i. 2, and xlii. 13), whilst he is granted twice the possessions, though before he "was the greatest of all the men of the earth." (Cf. i. 3 and xlii. 12.) He lives 140 years after his trial.

The book of Job is absolutely unique in the Old Testament. The hero is not a Jew. While the name Jehovah is used, the whole history of the Mosaic law and the chosen people is ignored. The author seems well acquainted with Egypt, its crocodiles (xli.), and its pyramids (?) (iii. 14), and the desert with its ostriches (xxxix. 13-18), its wild asses (xxiv. 5, xxxix. 5-8), and its too successful, tent-living, predatory tribes (xii. 6). The language is Hebrew, with various Aramaisms, and with a faint Arabic tinge. The view still held by most commentators is that the book is very ancient, and its author probably Moses. If so, then it is intelligible why there is a resemblance between expressions in Job and in Genesis. (Cf. Gen. ii. 23, and Job ii. 5; Gen. iv. 21, and Job xxi. 12, xxx. 31; Gen. vi. 2, and Job i. 6, &c.) Others place it about the time of Solomon or that of one of the succeeding kings; Renan says about a hundred years before the Captivity. Others make it even later, believing that the personification of the evil spirit is of Persian origin (i. 6, 7, 12). The Talmud originated the view, since adopted by various Biblical critics, that the book is only a parable. But against this view may be quoted Ezek. xiv. 14, 20, and James v. 11.

Job's-comforter, *s.* A false friend, who takes, or seems to take, pleasure in attributing one's misfortunes to one's own course of action whilst pretending to sympathise. Of course the allusion is to the severe rebukes administered to Job by his three friends, which forced him to exclaim "Miserable comforters are ye all" (Job xvi. 2).

Script. Biog.: The name of a Hebrew prophet, and of more than twelve other persons [¶] mentioned in the Old Testament (1 Sam. viii. 23; 1 Chr. iv. 35, v. 12, &c.)

¶ *The Book of Joel:*

Old Test. Canon: A prophetic book of the Old Testament, written by Joel, the second of the minor prophets. Nothing is known of him except that he was the son of Pethuel (i. 1). Joel seems to have lived in Judah. The main object of his book is to counsel repentance, in connection with a fearful visitation of locusts, accompanied by drought, which had desolated the land (ch. i., ii. 1–12). Then there follows a prediction that the Spirit of God should be poured out on all flesh, with celestial revelations to young and old (ii. 28), a passage which St. Peter refers to as being fulfilled in the Pentecostal effusion of the Holy Ghost (Acts ii. 16–21.)

The date of Joel is doubtful. He has been placed in the reign of Joash (B.C. 878–838), in that of Uzziah (809–756), in which case he was a contemporary of Amos, with whose prophecies several verses of Joel agree. (Cf. Joel i. 4, ii. 25, with Amos iv. 6–9; Joel iii. 4–6 with Amos i. 6–10; Joel iii. 16, with Amos i. 2, and ver. 18 with Amos ix. 13.) Others suppose him to have lived in the reign of Joram (B.C. 893 or 892–883–4); or in that of Manasseh (B.C. 699–644). If there is a refereuce in Joel iii. 2 to the captivity of the ten tribes, and in ver. 1 to that of the two, this would indicate a late date, as the mention of the Grecians in verse 6 perhaps may do. The canonical authority of Joel has never been seriously disputed.

Script. Biog.: The name of four men mentioned in the New Testament.

1. John the Baptist.

2. John the Apostle. His father was Zebedee (Matt. iv. 21), his mother Salome (cf. Matt. xxvii. 56 with Mark xv. 40, xvi. 1). His father was a fisherman who kept hired servants (Mark i. 20), and was therefore of some position. John was called with his brother James to follow Jesus (Matt. iv. 21). His nature was that sensitive one which is the temperament of genius, eloquence, passion, and love. In the first three gospels he figures as Boanerges, or Son of Thunder (Mark iii. 17), and in the excess of his zeal he wished to call down fire from heaven on a village of the Samaritans because "they did not receive" Jesus (Luke ix. 54). In the fourth gospel the loving elements of his character alone appear. He was the disciple whom Jesus loved (John xx. 2). He was personally acquainted with Caiaphas, the high priest (John xviii. 15, 16, 19, 28). At the crucifixion the mother of Jesus was entrusted to his care, and he took her to his house (John xix. 27). With Peter he was early at the sepulchre (xx. 2–4). After the resurrection he remained at Jerusalem for at least fifteen years (Acts iii., iv.; cf. xv. 6 with Gal. ii. 9.) Tradition asserts that he visited Rome, and was there, before the Latin Gate, plunged into a caldron of boiling oil, from which he was supernaturally delivered, so that he was a martyr in will, though not in deed. The Roman Church commemorates this circumstance on May 6, under the title S. Johannes ante Portam Latinam. It is also said that when a poisoned chalice was given him, he made the sign of the cross over it, and the poison fled from it in the form of an asp. At a later period he was banished to Patmos, where he saw the apocalyptic vision (Rev. i. 9). Tradition makes his last sphere Ephesus, where he died at an advanced age. [¶ 2, 3, 4; also Revelation.]

3. A dignitary mentioned in Acts iv. 6.

4. John Mark. [Mark.]

¶ 1. *Christians of St. John, Disciples of John:*

Ecclesiol.: The first name was given by Europeans to, and the second assumed by, a Jewish sect, perhaps descended from the Hemerobaptists mentioned by early Christian writers. They are followers of John the Baptist rather than of John the Apostle. They live in Persia and Arabia, especially at Bassora, and are called by the Orientals Sabeans.

2. *The Epistles General of St. John:*

(1) *The first epistle:* No name indicating authorship appears in the letter itself, but the style is that of the fourth gospel, and thirty-five passages are nearly the same in each. The external evidence for its genuineness and authenticity is very strong. Evidence in its favour is adducible from Polycarp, Papias as quoted by Eusebius, Origen, Clement of Alexandria, and Tertullian, and Eusebius ranked it among his homologoumena, or books unanimously accepted. Scaliger (1484–1558) believed that it was not from the Apostle, and was followed by Lange and the Tübingen school; but the general opinion of Christians is strongly in its favour. Its date has been fixed between A.D. 70 and 96 or 100, the last being the most probable. The epistle treats of love. The definition "God is Love," is from iv. 16. Its opening looks like an assault upon the doctrine of the Docetæ (q.v.). The verse (*v.* 7), concerning the Heavenly witnesses is considered an interpolation.

(2) *The second epistle:* It is written by "the elder" to "the elect lady and her children." The external evidence for it is much weaker than that for the first epistle, and Eusebius placed it among the antilogoumena, or books not universally accepted. Its theme, like that of the first, is love, but love does not require heretics to be entertained.

(3) *The third epistle:* This was addressed by "the elder" to "the well-beloved Gaius." The domineering Diotrephes is censured, Demetrius commended. In point of evidence it stands like the second epistle.

3. *The Gospel according to St. John:*

New Test. Canon.: The fourth gospel, and distinct from the others in various respects. They record chiefly the ministry of Jesus in Galilee; it treats of His labours in Jerusalem. Whilst they chiefly illustrate His humanity, it gives special prominence to His divinity. But there are resemblances too. The family of Bethany figures in Luke x. 38–42, as well as in John; the last gospel records the feeding of the five thousand (John vi. 5–13), as do the others (Matt. xiv. 15–21, Mark vi. 35–44, Luke ix. 10–17). So also the crucifixion and the resurrection are recorded in them all.

The author of the book of John was well acquainted with the topography of Jerusalem (ch. v. 2, ix. 7), and with the Jewish feasts, which he carefully records (ii. 13, vii. 2, x. 22, &c.). His Greek is of an Hebraic type, though not so much so as that of the Apocalypse. As the author tells more than any of the other three evangelists what passed within the apostolic circle, presumably he was himself an apostle. The book itself does not name its author; the nearly uniform voice of antiquity assigned it to St. John. In modern times there has been serious controversy on the subject, rationalists maintaining that it was penned too late in the second century to have emanated from St. John, who, at latest, cannot have lived beyond A.D. 100. The large majority of theologians, however, consider it of earlier date. On the one hand Papias, as quoted by Eusebius, does not seem to have known it, though he was bishop of Hieropolis, near Ephesus, where it is believed to have been first published. On the other hand, there are abundant testimonies to it in the latter half of the second century. Thus, Tatian (166–171) quotes it often, and Irenæus, bishop of Lyons, from about 177, does so eighty times, also perhaps Justin Martyr refers to it about A.D. 150, 138 or 139, or 147, and again in 161, possibly Barnabas and Ignatius earlier. If in the latter half of the second century the knowledge of it was so widely diffused, there must have been a prior period during which acquaintance with it must have been spreading from a centre. Hilgenfeld, a recent rationalistic writer (1875) is willing to grant it as early a date as 132 to 140, and another one, Keim (1875) as 130 A.D. But in 1868 Prof. Hofstede De Groot, of Groningen, in Holland, cited from Hippolytus a statement that the gnostic Basilides, whose exact date had been unknown, had a communication from Matthias the Apostle, whom he personally knew. If so, he lived in the first century, and he undoubtedly quotes the Gospel by St. John. If Hippolytus's statement is correct, then the gospel by St. John is undoubtedly a production of the apostolic era.

(*Todd & Bowmann: Phys. Anat.*, i. 131.) The different kinds of joints may be thus classified: 1. Synarthrosis: (1) Suture, (2) Schindylesis, (3) Gomphosis, (4) Amphiarthrosis. 2. Diarthrosis: (1) Arthrodia, (2) Enarthrosis, (3) Ginglymus, and (4) Diarthrosis rotatorius. 5. *Carp.:* A mode of securing together the meeting edges of wooden structures; the place where one piece of timber is united to another. The straight joint is where the edges make a butt-joint, being planed straight. Timbers are generally joined by mortises and tenons, or by straps and bolts. The various kinds of joints are named according to their forms and uses, thus:

(1) A *butting joint*, in carp., is one in which the fibres of one piece are perpendicular to those of the other; in machinery, one in which the pieces meet at right angles.

(2) A *bevel joint*, one in which the plane of the joint is parallel to the fibres of one piece and oblique to those of the other.

(3) *Dove-tail joint.* [Dovetail.]

(4) A *longitudinal joint* is one in which the common seam runs parallel with the fibres of both.

(5) A *mitre joint*, one formed by the meeting of matching pieces in a frame, the parts uniting on a line bisecting the angle, which is usually, but not necessarily, one of 90°.

(6) A *square joint*, one in which the plane of the joint is at right angles to the fibres of one piece, and parallel to those of the other.

(See also mortise, rabbet, scarf, tenon, universal joint, &c.) Other joints are known by some peculiarity of finish or application, as bracket, chamfered, covering, diamond, frontal, plain, side, suspended joints.

6. *Geol.:* A natural fissure or line of parting traversing rocks in a straight and well-determined line, often at right angles to the planes of stratification. If in a quarry a sufficient number of joints cross each other, the rock is broken up into symmetrical blocks, thus greatly facilitating the labours of the men employed. The faces of the joints are generally smoother and more regular than the surface of true strata. The partings which divide columnar basalt into prisms are joints. The spaces between two joints show no tendency to split indefinitely, thus distinguishing it from slaty cleavage. [Cleavage.] (*Lyell.*) Rutley considers jointing due to the consolidation either of sediment by drying or of eruptive matter by cooling. This makes them so contract as to produce fracture along more or less parallel lines.

Law: (See extract).

"An estate in *joint-tenancy* is where lands or tenements are granted to two or more persons, to hold in fee-simple, fee-tail, for life, for years, or at will. Its creation depends on the wording of the deed or devise by which the tenants claim title; for this estate can only arise by purchase or grant, that is, by the act of the parties, and never by the mere act of law. Joint-tenants must have one and the same interest. One cannot be entitled to one period of duration or quantity of interest in lands, and the other to a different; one cannot be tenant for life, and the other for years; one cannot be tenant in fee, and the other in tail. They must also have an unity of title; their estate must be created by one and the same act. *Joint-tenancy* cannot arise by descent or act of law, but merely by purchase, or acquisition by the act of the party: and, unless that act be one and the same, the two tenants would have different titles, and if they had different titles there would be no jointure. There must also be an unity of time; their estates must be vested at one and the same period, as well as by one and the same title. As in case of a present estate made to A and B; or a remainder in fee to A and B after a particular estate; in either case A and B are joint-tenants of this present estate, or this vested remainder. Lastly, in *joint-tenancy* there must be an unity of possession; for joint-tenants are said to be seised *per my et per tout*, by the moiety and by all: that is, they each of them have the entire possession as well of every parcel as of the whole."—*Blackstone: Comment.*, bk. ii., ch. 9.

¶ *The prophecies of Jonah:*

Old Testament Canon: The fifth in order of the minor prophets, but perhaps the first in date. The book is partly in prose, partly in poetry. It opens with a divine commaud giveu to Jonah to go to Nineveh and cry against it for its wickedness. In place of obeying this injunction, the prophet, who was of perverse disposition, went to the sea, and paid his fare for a voyage to Tarshish. A storm arising, those on board cast lots to ascertain whose delinquency had raised the tempest, and the lot fell upon Jouah. He having admitted that he was fleeing from Jehovah, was cast overboard by his comrades, wheu the agitated ocean sank into a calm. A great fish swallowed the prophet, who remained alive in the body three days and three nights. His prayer offered from his living dungeon being answered, the fish vomited him out on the dry land. A second time he was ordered to go to Nineveh, and this time he obeyed. The people alarmed by his declaration that in forty days the city should be destroyed, humbled themselves before God, and thus averted the threatened judgment. On this the prophet petulantly complained of the Divine goodness, and was yet more impatient when a gourd which had grown up in a night to shelter him as rapidly withered away. Jehovah vindicated his action and justly rebuked the prophet. Some have thought the book an allegory rather than a narrative of real events. But it is quoted apparently as a history iu the New Testament, and in one place the confinement of Jonah in the whale's belly is regarded as typical of the similar period during which Jesus was to remain in the bowels of the earth (Matt. xii. 39–41, xvi. 4; Luke xi. 29, 30, 32).

Jŏsh'-ū-a, *s.* [Heb. יְהוֹשֻׁעַ (*Yehoshua*); Gr. Ἰησοῦς (*Iēsous*).] [JESUS.]

Scrip. Biog.: The name of four persons mentioned in the Old Testament (Joshua i. 1; 1 Sam. vi. 14, 18; 2 Kings xxiii. 8; Haggai i. 1). The last-named Joshua is the Jeshua of Ezra v. 2. The earliest and most celebrated of the four, after whom the other three were named, was the son of Nun, an Ephraimite (1 Chron. vii. 27), who first appears as commanding the Israelites by appointment of Moses during the fight with Amalek (Exod. xvii. 9, 10, 13). He was with Moses just after his descent from Sinai (xxxii. 17); he was then a servant of Moses, and a young man (xxxiii. 11). He was one of two spies who reported the practicability of conquering Canaan (Numb. xiv.). Before the death of Moses Joshua was divinely named his successor, and formally invested with authority (xxvii. 18). He afterwards led the Israelitish host in the conquest of Canaan. He died at the age of 110, and was buried at Timnath-serah, in Mount Ephraim (Joshua xxiv. 30).

¶ *The Book of Jeshua:*

Scrip. Canon: The sixth book of the Old Testament, immediately succeeding the Pentateuch in the Hebrew. The name appears to have been given because Joshua was the leading human personage in the book. It is naturally divided into three parts: first, the conquest of Canaan (i.–xii.); second, the partition of the land, or Jewish domesday-book (xiii.–xxii); and third, Joshua's final address to the people (xxiii., xxiv.). The events recorded are considered to have occupied about twenty-five years, from B.C. 1451 to 1426. The expression "to this day" occurs fourteen times in the book, once of Rahab's dwelling among the people (vi. 25), and apparently of the life of Caleb (xiv. 14). Hence, all but the concluding verses have been attributed to Joshua, or one of the elders who outlived him. Rationalists place it much later, Colenso resolving it, like the books of the Pentatcuch, into various parts. One is an original story, which he dated in the later part of David's or the earlier part of Solomon's reign. A considerable part he attributes to the "Deuteronomist," whom he places in the reign of Manasseh, and he supposes a third portion to belong to what he terms the "Later Legislation," during the Captivity.

II. *Technically:*

1. *Jewish:* Properly the trumpet or horn blown in a certain year, or the sound it made; now used more generally for the year itself. It occurred every fiftieth year. Seven was a sacred number, and it became yet more so if multiplied by itself (7×7), after which came the jubilee. There was to be no tillage or harvest that year (Levit. xxv. 11, 12). Any descendant of those among whom Joshua partitioned the land who, from poverty, had parted with his property, was to receive it back (xxv. 13-34; xxvii. 16-24); and those Israelites who were the slaves of their brethren, or of foreigners resident within the land, were to go free (xxv. 39-54). The jubilee seems to be alluded to in Ezek. xlvi. 17; Isa. lxi. 1, 2; Neh. v. 1-19; cf. also Num. xxxvi. 4, 6, 7; 1 Kings xxi. 1-4); but no historic description, in the Bible or elsewhere, of a jubilee actually kept in a particular year has descended to our times.

"It shall be a yere of *jubelye* vnto you."—*Leviticus* xxv. (1551.)

2. *Roman Catholic:* A feast first instituted in A.D. 1300 by Boniface VIII., who proposed that it should be celebrated at the commencement of each succeeding century; Clement VI. enacted that it should recur every fifty years, and Urban VI., in 1389, that it should be every thirty-three years. Paul II. reduced the period to a quarter of a century, and since his time there has been no alteration. A pilgrimage to Rome was the original condition of obtaining the indulgence promulgated at a jubilee, but latterly this has been commuted. There was no jubilee in 1800, the Holy See being vacant.

2. Conformity to Jewish rites and ceremonies.

II. *Religion:* One of the most important faiths of the world, which Christians, as well as Jews, consider to have been revealed by God.

(1) *Ancient Judaism:* The earliest form of the Jewish faith was patriarchal (q.v.). On the night of the Israelitish departure from Egypt an essential part of Judaism, in its second or more developed form, was begun by the institution of the passover (Exod. xii. xiii.). At Sinai two tables of stone were given containing the ten commandments. Subsequently there was revealed to Moses, to be by him communicated to the people, a complicated system of ceremonial observances, interspersed with judicial enactments. A splendid tabernacle—*i.e.*, a tent—on a divine model, was erected as the habitation of Jehovah, in the journeyings through the wilderness, to be in due time followed by a temple, when the people were permanently settled. A hereditary priesthood was consecrated, and a theocratic form of government maintained, the supreme civil

ruler, whether lawgiver, military leader, judge, or king, being regarded as the vicegerent of God. Ancient Judaism was the precursor of Christianity and the germ from which it sprang; and Christians generally believe that all the ceremonies, sacred personages, &c., of the older economy were types and shadows of the life and sufferings of Jesus Christ (Heb. ix., x., &c.). Colenso, in common with some rationalistic writers, believes that what he terms the Levitical or Later legislation was never really put in force till after the Babylonish Captivity.

(2) *Modern Judaism:* After the Jews lost their independence, and especially after the destruction of Jerusalem, the judicial regulations of the Mosaic law ceased to be observed. Tradition also gained increased authority, and in the latter half of the fourth century arose the Jerusalem, and in the sixth the Babylonian Talmud, containing the rules, constitutions, precepts, and interpretations intended to supplement those of the Old Testament. Notwithstanding these and other changes, modern Judaism still bears very considerable resemblance to the ancient type of the faith.

¶ *The General Epistle of Jude:*

New Test. Canon: A short epistle penned by Jude, the servant of Jesus Christ and brother of James. The James was probably "the brother of the Lord," who may or may not have been identical with the apostle James, the son of Alphæus. So much of Jude's epistle is like 2 Peter, that portions of the one seem to have been transcribed from the other. There is a slight probability in favour of the view that 2 Peter was the original and Jude the copy. (Cf. 2 Peter ii. 4, 6, 10, 11, 15, &c., with Jude 6, 7, 8, 9, 11, &c.) It is believed that Jude quotes an apocryphal work, the *Book of Enoch* (verses 14, 15), and, according to Origen, another, *The Assumption of Moses* (verse 9). Jude is not in the Peschito or ancient Syriac version; but it is in the Muratorian fragment, about A.D. 170, and in the Old Latin version; it is referred to also by Tertulliau, Clement of Alexandria, Origen, and Jerome. Eusebius placed it among his Antilogoumena, but the Council of Laodicea, about A.D. 360, and that of Hippo, A.D. 393, finally, fixed it in the canon.

I. *Ordinary Language:*

1. A civil officer invested with power to hear and determine causes, civil or criminal, and to administer justice in courts held for that purpose.

"*Judges* ought to remember, that their office is *jus dicere,* and not *jus dare;* to interpret law, and not to make law, or give law."—*Bacon: Essays; Of Judicature.*

2. A person authorized or empowered in any way to decide a dispute or quarrel.

"Who made thee a *judge* over us?"—*Exodus* ii. 14.

3. A person appointed to decide in a trial of skill between two or more parties.

"And now by this, their feast all being ended,
The *judges* which thereto selected were,
Into the Martian field adowne descended."
Spenser: F. Q., IV. v. 6.

4. One who has power to determine the destiny of men.

"Shall not the *Judge* of all the earth do right?"—*Genesis* xviii. 25.

5. One who has skill, science, or experience sufficient to decide upon the merits, value, or quality of anything; a connoisseur; a critic.

"A perfect *judge* will read each piece of wit,
With the same spirit that its author writ."
Pope: Essay on Criticism, 233.

II. *Technically:*

1. *Modern Law:* In the United States the Judges of the Supreme Court are appointed by the President with the consent of the Senate. In the courts of the several states they are either appointed by the governor, elected by the legislature, or elected directly by popular suffrage. The last named is the method pursued in most of the newer states and in some of the older ones which have recently changed their constitutions. A Judge is not liable in a civil suit brought for acts performed as part of his official duty, but may be impeached for any high crime or misdemeanor. In the judgeships of Great Britain rules not unlike those above named exist, all the superior judges being appointed by the Crown.

2. *Jewish Hist. (Pl.):* Certain remarkable individuals raised up in Israel after the death of Joshua and prior to the establishment of the Jewish monarchy. At that time there was little unity among the tribes, each of which, like a Scottish Highland clan, looked up to its own individual chief, and not often to any higher human authority. Some judges owed their power to having been the first to rise against foreign oppression, which they overthrew; others discharged only peaceful functions. All acted in the Jewish theocracy as vicegerents of Jehovah. The series of events, oftener than once repeated, was first, that the people were seduced into idolatry; next, that as a punishment for this, they were conquered, and placed under the yoke of a foreign oppressor; then a judge arose who under God set them free, and the land had rest normally for forty years. The Hebrew name Shophetim sometimes means princes as well as judges. The functions of the judge in some respects resembled those of a Roman dictator, and in others those of a Muhammadan Mahdi. St. Paul considered the rule of the judges to have continued 450 years (Acts xiii. 20). A date apparently inconsistent with this (1 Kings vi. 1) is believed to be an erroneous reading.

¶ *The Book of Judges:*

Old Test. Canon: The seventh book in order of the Old Testament. It was named Judges because at the period to which it refers Israel was ruled by men of that designation. [II.] It consists of five sections: a first introduction (i.–ii. 5), a second one (ii. 6–iii. 6), the main portion or consecutive narrative (iii. 7–xvi. 31), the first appendix (xvii.–xviii.), and the second one (xix.–xxi.). Two authors seem to have been at work upon it, each falling back upon ancient documents. The first wrote i.–iii. 6, xvii.–xxi., and the second iii. 7–xvi. 31. The first-mentioned writer never alludes to judges; it is he who uses the expression "in those days there was no king in Israel" (xvii. 6, xviii. 1, xix. 1, xxi. 25), implying that he did not write till kings had been appointed. If the "captivity of the land" (xviii. 30) be the Assyrian or even the Babylonish captivity the book is a late one, though the Aramaisms in it are but few. It has been always accepted as canonical. In the New Testament it is referred to in Acts xiii. 20 and Heb. xi. 32.

¶ *Judge* is the general term; *umpire, arbiter,* and *arbitrator* are only species of the *judge.* The *judge* determines in all matters disputed or undisputed; he pronounces what is law for the present, as well as what will be law; the *umpire* and *arbiter* are only *judges* in particular cases that admit of dispute.

¶ The *judgment* is that faculty which enables a person to distinguish right and wrong in general; *discretion* and *prudence* serve the same purpose in particular cases. The *judgment* is conclusive; it decides by positive inference; it enables a person to discover the truth; *discretion* is intuitive; it discerns or perceives what is in all probability right. The *judgment* acts by a fixed rule; it admits of no question or variation; the *discretion* acts according to circumstances, and is its own rule. The *judgment* determines in the choice of what is good; the *discretion* sometimes only guards against error or direct mistakes; it chooses what is nearest to the truth. The *judgment* requires knowledge and actual experience; the *discretion* requires reflection and consideration; *prudence* looks only to the good or evil which may result from the thing; it is, therefore, but a mode or accompaniment of *discretion;* we must have *prudence* when we have *discretion,* but we may have *prudence* where there is no occasion for *discretion.* Those who have the conduct or direction of others require *discretion;* those who have the management of their own concerns require *prudence.*

Apocrypha : The fourth of the apocryphal books. The narrative opens with the "twelfth year of the reign of Nabuchodnosor, who reigned in Nineve, the great city." That potentate, finding his armies thwarted in their progress to the west, resolved to take signal vengeance. His chief opponents were the Israelites, who fortified themselves in Bethulia. While Holofernes, his general, was besieging this stronghold, the heroine of the book, Judith, the beautiful widow of Manasses, went forth to the Assyrians, pretending that she had deserted her people. She fascinated Holofernes, who after a time took her to his tent, where, as he was lying drunk, she cut off his head, escaping back with it to the fort at Bethulia. On the loss of their leader the Assyrians fled, the Israelites pursuing and inflicting on them great slaughter. The book apparently professes to have been penned just after the events recorded (xiv. 10); but the earliest known historic testimony to its existence is by Clement of Rome (*Ep.* i. 55), though it probably existed as early as 175 to 100 B.C. The ablest critics consider it a fiction rather thau a genuine history.

1. *Hind. Myth. :* One of the 1,000 names of Vishnoo, the second god of the Hindoo triad. Juggernaut is Vishnoo, specially in his eighth incarnation, Krishna. The great seat of his worship is at Pūrī, in Orissa, where he is associated with his brother Balbhadra, Baldeo, or Balaram, and their sister Subhadra. The idols have no legs, and only stumps of arms; the heads and eyes are very large. The two brothers have arms projecting horizontally from the ears. They are wooden busts of about six feet high. Balaram is painted white, Juggernaut black, and Subhadra yellow. Juggernaut's car is forty-three and a half feet high. It has sixteen wheels, each six and a half feet in diameter. The brother and sister have also cars. There are thirteen festivals each year. The chief is the Rath Jattra, or Car Festival, at which the three idols are brought forth, being dragged out in their cars by the multitudes of devotees. Formerly a few fanatics threw themselves beneath the wheels: this is not now permitted. (*Peggs : Orissa Mission.*) The Rev. Dr. Stevenson believes that the permission of all castes to eat together at Juggernauth, though no where else, and the alleged preservation of a bone of Krishna within the Juggernauta idol, raise the suspicion that the worship of this divinity is of Booddhist rather than of Brahminical origiu.

2. *Indian Hist. & Arch. :* The present temple of Juggernaut was completed in A.D. 1198, at an expense of nearly £500,000. Its base is thirty feet square, its altitude above the platform on which it stands 180, or above the ground, 200. Two stone walls enclose it, the inner 445 and the outer 650 feet square. The British obtained possession of it in 1803. They found that the pilgrims had paid a tax to the Mahrattas. In 1806, the Anglo-Indian British Government, uuder Sir George Barlow, took the pilgrims' tax and directed the worship of the temple. In 1839, the pilgrims' tax was abolished, and the temple expenses fixed at a certain sum, paid from public revenue. In June, 1851, the government ceased to have any connection with the temple.

Zool.: Onotaurus. An imaginary hybrid between bovine and equine species. According to Buffon (xiv. 248) these hybrids were mentioned by Columella, who was quoted by Gesner; but Blumenbach (ed. Bendyshe, p. 77) says, "I cannot find the mention in the one, or the quotation in the other," and he considers "Gesner (*Hist. quad. vivap.*, pp. 19, 106, 799) was the first to mention jumars." He is followed by Jerome Cardan, J. Bap. Porta, and John Léger, who actually gives an engraving of one. He says:

"*Jumars* are born from the union either of a bull and a mare, or a bull and an ass; the former are taller, and called *Burt*, the latter smaller and called *Bif*. . . . These hybrids are exactly like an ox in the head and tail, and the places for horns are marked by small protuberances. As to the rest, they are exactly like an ass or a horse. Their strength is wonderful, especially when compared with their small body; they are smaller than common mules; they eat little and are swift. I myself went in one day 18 miles among the mountains with a *jumar* of this kind, much more comfortably than I could have done with a horse."—*Hist. des Eglises Evang. de Piémont* (Leyde, 1669), pp. 7, 8.

Haller (*Phys.*, viii. 9) was probably the first to suspect the non-existence of the jumar. At the request of Bonnet and Spallanzani, Card. delle Lanze had two jumars dissected. The dissection established the fact that these pretended jumars were hinnies, the larynx, glottis, ventricle, and biliary ducts were all specifically equine, not bovine. Blumenbach concludes (*loc. cit.*, p. 79), "I myself have lately seen at Cassel quite closely two hinnies, which report asserted to be jumars. They were of the size of a large ass, and very like one in shape, black in colour, with horses' teeth in each jaw, no vestige of rumination, &c. The *Dictionnaire Classique d' Hist. Nat.* (Paris, 1826) says, "The hybrid born from the union of a bull and a mare, or a horse and a cow, and called jumar by the ancients, never existed."

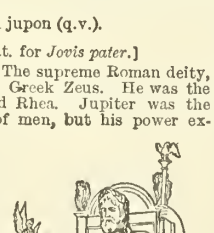
Jû'-pĭ-tĕr, *s.* [Lat. for *Jovis pater.*]

1. *Rom. Antiq.:* The supreme Roman deity, identified with the Greek Zeus. He was the son of Saturn and Rhea. Jupiter was the king and father of men, but his power extended over the deities also; and everything was subservient to his will except the Fates. From him mankind received their blessings and miseries; they looked on him as acquainted with everything past, present, and future. The oak was sacred to him, because he first taught mankind to live on acorns. His most famous temple was at Elis, in Olympia, where, every fourth year, the Olympic games were celebrated in his honour; and his most favourite oracle was at Dodona, in Epirus. The Romans considered Jupiter as the especial patron of their city. He is generally represented as sitting on a golden or ivory throne, holding in one hand thunderbolts ready to be hurled, and in the other a sceptre of cypress, while the eagle stands with expanded wings at his feet. White, the colour of the day, was sacred to him, and the oak was his sacred tree.



THE OLYMPIAN ZEUS.
(*After Phidias.*)

2. *Astron.:* The largest planet of the solar system. Its diameter is about 85,000 miles, its bulk nearly 1,250 times that of the earth; but, its density being one-fourth that of the earth, it weighs only about three hundred times as much as our planet. The average distance of Jupiter from the sun is 478,000,000 miles; and a railway train, travelling fifty miles an hour, would require nine centuries to go from the sun to Jupiter. The latter body revolves on its axis in about nine hours and fifty-five minutes, which is the length of its day and night. Though travelling in its orbit round the sun at the rate of 28,743 miles an hour, it takes nearly twelve years to complete its revolution; this therefore is the length of its year. It is surrounded by four conspicuous belts of a brownish-gray colour, two north, two south, of the equator, with feebler ones towards the poles. The equatorial region of the planet is brighter than the rest. Jupiter has four satellites, numbered first, second, third, and fourth. If named, they are called Io, Europa, Ganymede, and Callisto. The first revolves around him in 1 terrestrial day 18 hours and 28 minutes, the second in 3 days 13 hours 14 minutes, the third in 7 days 3 hours 43 minutes, the fourth in 16 days 16 hours and 32 minutes. They were first seen by Galileo, with his small telescope, on January 7, 1610, and identified on the 13th as small planets revolving round the luminary. They are now called satellites. (*E. Dunkin, F.R.A.S.*)

"A plea to the *jurisdiction* is where an indictment is taken before a court that has no cognizance of the offence. 2. The power or right of governing or legislating; the power or right of exercising authority, or of making and enforcing laws.

3. The extent to which such authority extends; the district within which such power may be exercised.

II. *Roman Theol.:* Ecclesiastical jurisdiction is defined as the "power which is concerned with the worship of God and the salvation of souls, and is exercised *in foro externo* as well as *in foro interno.*" By commission from the Supreme Pontiff, whose powers, theologians teach, are derived from Christ through Peter, are constituted legates, patriarchs, primates, and prelates; by law or canon, rectors of universities, superiors of convents, provosts, and vicars-general receive their jurisdiction; and a jurisdiction exercised without challenge for forty years is valid by prescription. To absolve a penitent, jurisdiction is necessary. Secular priests obtain this from their bishops; but confessors belonging to the regular orders have jurisdiction from the Pope over all the faithful when they have obtained the approbation of the bishop. A penitent *in articulo mortis* may be validly absolved, even in reserved cases (q.v.), by a simple priest, even if degraded, apostate, or irregular. In ordinary cases, absolution given by a priest without jurisdiction is void. (*Addis & Arnold.*)

jû'-rў, * ju-rie, *s.* [Fr. *jurée*, prop. the fem. of *juré*, pa. par. of *jurer* = to swear; Lat. *juro.*]

1. A number of men selected according to law, impannelled, and sworn to inquire into and to decide upon facts, and to give their true verdict according to the evidence legally laid before them. In our Courts of Justice there are two kinds of juries, grand-juries, and petty or common-juries. [For grand-jury, see under Grand.] Petty or common-juries consist of twelve men each, and the verdicts given must be unanimous. They are appointed both in civil and criminal cases. After the evidence in a cause has been given, and summed up by the judge, the jury retire to consider their verdict. Trial by jury is a constitutional provision in many of the states, though the conditions attending jury trials differ somewhat in different states. The law permits the challenging of individual jurors, and this right has frequently been abused, so that it is often difficult to impanel a jury. Each juror must also swear that he has formed no opinion as to the case on trial. In England there are special juries, where the case seems too important for a common jury. In Scotland the number of the jury in criminal cases is fifteen, and the verdict is determined by the voice of the majority. In civil and revenue cases the number is twelve, and the jury are not required to be unanimous in their verdict. In cases of misdemeanor, felony, and high-treason the jury must be unanimous.

"No man can be convicted, upon an indictment, at the suit of the crown of any offence, unless by the unanimous voice of twenty-four of his equals and neighbours: that is, by twelve at least of the grand *jury*, in the first place, assenting to the accusation; and afterwards, by the whole petit *jury*, of twelve more, finding him guilty, upon his trial. But if twelve of the grand *jury* assent, it is a good presentment, though some of the rest disagree. And the indictment, when so found, is publicly delivered into court."—*Blackstone: Comment.*, bk. iv., ch. 23.

2. *Hist.:* It has been much disputed whether the germ of our modern jury system was of Anglo-Saxon or Norman origin. Those who hold the former view attribute it to King Alfred, about A.D. 886. It does not seem to have been closely connected with the appointment of twelve compurgators for canonical purgations. The establishment of proper jury trials seems to have been under Henry II., late in the twelfth century. It was well rooted in the time of King John, and is insisted on in Magna Charta, as the great bulwark of liberty. In 1353, under Edward III., juries empannelled to try aliens were to consist half of foreigners. Various Acts have since been passed on the subject of juries, but the changes made have not been of essential importance.

"It is true, the terms of *jury* and verdict were introduced by the Normans, with many others in the style and practice of our laws; but the trials by twelve men, with that essential circumstance of their unanimous agreement, was not only used among the Saxons and Normans, but is known to be as ancient in Sweden."—*Temple: Introd. to Hist. ¶ (1) *Justices of the Peace:* Local magistrates elected by the people and having limited jurisdiction in minor civil and criminal matters of law; their courts are not courts of record. A corresponding office exists in England, with, however, greater power and jurisdiction.

By the demise of the crown; that is, in six months after. 2. By express writ under the great seal, discharging any particular person from being any longer justice. 3. The power, office, and duty of a *justice* depend on his commission, and on the several statutes which have created objects of his jurisdiction. His commission, first, empowers him singly to conserve the peace. It also empowers any two or more to hear and determine felonies and other offences, which is the ground of their jurisdiction at sessions. And as to the powers given to them by the several statutes, which have heaped upon them such an infinite variety of business, that few care to undertake, and fewer understand, the office; they are such, that the country is greatly obliged to any worthy magistrate that without sinister views of his own will engage in this troublesome service. And therefore, if a *justice* makes any undesigned slip, great indulgence is shown to him in the courts of law; for he cannot be sued for any oversight, without notice beforehand; so as to have an opportunity of making amends."—*Blackstone: Comment.*, bk. i., ch. 9.

¶ *Justice* is a written or prescribed law, to which one is bound to conform and make it the rule of one's decisions: *equity* is a law in our hearts; it conforms to no rule but to circumstances, and decides by the consciousness of right and wrong. The proper object of *justice* is to secure property; the proper object of *equity* is to secure the rights of humanity. *Justice* is exclusive, it assigns to every one his own; it preserves the subsisting inequality between men: *equity* is communicative; it seeks to equalize the condition of men by a fair distribution. *Justice* is inflexible, it follows one invariable rule, which can seldom be deviated from consistently with the general good; *equity*, on the other hand, varies with the circumstances of the case, and is guided by discretion. K.

K. The eleventh letter and the eighth consonant of the English alphabet. This letter has before vowels, and before all consonants except *n*, the same phonetic value in all the alphabets where it appears—a guttural momentary sound produced by raising the back of the tongue to the back of the palate, as in *kill, keen, king.* Before *n* it is not sounded in English, as in *knee, knell, knife.* From the sixteenth to the last century it was used in English at the end of words after *c*, apparently to strengthen the hard *c*, as in *alchemick, musick, publick*, but this usage is now confined to monosyllables, as *check, clock, duck, sick.* It also frequently occurs at the end of monosyllables followed by *e* mute, as *duke, strike*; or alone after long vowels or diphthongs, as in *seek, speak, hook, look, hawk*, or preceded by the consonants *l, n, r*, as *milk, shrink, dirk.* It is met with in the middle of words only where the monosyllable to which it belongs are compounded, as in *speaking, firkin, mawkish, tinker, inkling, mankind.* It takes a prominent part in the formation of derivatives, as in the suffixes *-ock, -ikin.*

¶ Forming part of the original Phœnician alphabet, *k* passed into Greek and the oldest Latin; but *c* was substituted for it in the latter at an early date, and it only survived in a few common abbreviations (see below). In the early part of the present era, moreover, the sound of *k* or *c* (hard) was lost in Italy. It underwent palatization—*i.e.*, it was produced by raising the middle instead of the back of the tongue to the palate, and *c* was sounded as *ch* (*tsh*). Those modern alphabets, therefore, derived from Italy (*i.e.*, Celtic, Mod. Italian, French, and Spanish) have, properly speaking, no *k*, and the sound and letter are only present in a few foreign importations. In those alphabets, however, derived through the Greek (*i.e.*, Teutonic and Slavonic) *k* plays an important part. But in England the letter holds a very ambiguous position. The earliest Anglo-Saxon alphabet, being derived from Roman missionaries, was without *k*, and *c* was generally used to represent its sound, but German influence soon introduced it to northern England, and made it interchangeable with *c* throughout the country, and the two letters were used indifferently (cf. *cyning, kyning*). The Norman French of the Conquest brought in many words in which *k* could have no place, and not only often softened the old *c* (hard) to *ch* or *c* (sibilant) (cf. *cild, child*), but gave *c* general predominance over *k*, even when the original sound was retained. In northern England, however, it continued to be freely used in words in which in southern dialects *k* had given way *ch* or *c* (sibilant)—N. *rike* (kingdom), S. *riche*; N. *croke* (cross), S. *crouche*; N. Alnwick, S. Greenwich; N. *Caister*, S. *Chester.* In Lowland Scotch, likewise, *k* still retained, as it does to this day, its old importance (cf. *kirk* and *church*). *K* has undergone many other phonetic changes in Indo-European languages. In the Græco-Latin branch it was sometimes labialized, and became *p* (cf. Lat. *equus* and Gr. ἵππος (*hippos*) = horse, Sansc. *kankan*, and Gr. πέντε (*pente*), *i.e.*, πέμπε (*pempe*) = five). In English it has been occasionally replaced by *t* (cf. Old Eng. *bak*, Mod. Eng. *bat, make* = *mate, maked* = *made*).

Their houses are of stone; they dwell in towns, and engage not only in the cultivation of figs, vines, and tobacco, but in the manufacture of lime, tiles, soap, and domestic utensils. The fine arts are not unknown to them, and wood-engraving and engraving on metal are practised among them. Though Muhammadans by religion, their political institutions are essentially democratic. The Arab language is spoken by the majority of them, but their original tongue is not lost, and their popular literature, preserved through oral transmissions, has been committed to writing by a French savant. They numbered in 1864, 2,400,000 persons, and their province is known as Kabylia or Kabylie. The French, in whose territory they now lie, find them active soldiers and artisans.

Ornith.: Nestor meridionalis—a New Zealand parrot.

kăk-ą-pā'-ō, kă-kă-pō', *s.* [From Maori = night-parrot.]

Ornith.: A bird of the parrot family (*Psittacidæ*), although it is in many respects of a unique type. Indigenous to New Zealand, and called by the English there the Ground Parrot, or Owl Parrot, it became first known to ornithologists in 1843, and is now represented in most museums of natural history. Its scientific name is *Strigops habroptilus.* Its habits are wholly nocturnal, hiding in rocks and under the roots of trees by day, seeking food only by night. In size it resembles a raven; its feathers are of green or of brownish-green colour, striped longitudinally with yellow; it has a very powerful beak, with hairs and elongated feathers about its face, as in the case of the owl. Its wings are too short to enable it to fly, and it chiefly walks along the ground or climbs trees, thus making it a prey to eats, rats, and other animals. It is fast becoming extinct.

"Among the additions was a second living specimen of the *kakapo,* or Ground Parrot of New Zealand."—*Zool. Soc. Proc.,* 1871, p. 102.

Kâ'-lēe, Kâ'-lî (1), *s.* [Sansc., the fem. of *kala* (q.v.).]

Hindoo Myth.: The sacti or consort of Siva in the form Kala (q.v.). She is represented with four arms, one holding a sword, the second a trident, the third a club, and the fourth a shield. A dead body hangs from each of her ears; human skulls strung together form her necklace; and the hands of slaughtered giants interlaced with each other compose her girdle. Her eyebrows are matted and stained with the gore of monsters whom she has just torn to pieces and devoured. She is exceedingly pleased when her altars are inundated with human blood. The Thugs selected her as their tutelary deity. The swinging festival is in her honour. [Swinging-festival.] She symbolizes time, and the destruction she effects is the personification of the ravages of time. Her worship seems to have been of Turanian origin, though it is now firmly rooted in modern Brahmanism.

ka-leĭ'-dŏ-phōne, *s.* [Gr. καλός (*kalos*) = beautiful; εἶδος (*eidos*) = form, and φωνή (*phōnē*) = sound.] An instrument invented by Prof. Wheatstone, to illustrate the phenomena of waves of sound. A thin elastic bar is fixed by one extremity, and at its free end carries a silvered or polished ball; a ray of light is reflected from this ball, and when the thin plate is vibrated, the fine point of light describes various curves, corresponding with the musical notes produced by the vibrations.

ka-leĭ'-dŏ-scōpe, *s.* [Gr. καλός (*kalos*) = beautiful; εἶδος (*eidos*) = appearance, and σκοπέω (*skopeō*) = to behold.]

Optics: An instrument which, by means of reflection, enables us to behold an endless variety of beautiful forms of perfect symmetry. It is made by taking two plane mirrors, usually formed of slips of glass, blackened at the back, from six to twelve inches in length, and diminishing in breadth from about 3 inches or 1½ inches at one end, to 1 or ¾ inch at the other. Their shape is therefore trapezoidal, but they may be made rectangular with equal success. The mirrors are fixed together by their corresponding sides, so that their reflecting surfaces face each other, and form together any angle that is a sub-multiple of 360° (*i.e.* 120°, 90°, 72°, 60°). The angle at which they are usually placed is 60°. Thus arranged, the mirrors are set in a hollow, conical tube made of brass, tin, or paper, a little larger than the mirrors, and of sufficient diameter at its wider end just to include their points. The small end of the tube is closed, space only being left for an eyehole, which should be in the plane of both the mirrors. At the large end of the tube, and close to the bases of the mirrors, a circular object-box is fixed, of the same diameter as the base of the tube. Its inner side is covered with transparent glass, its outer with ground opaque glass. It is filled with chips of coloured paper, coloured glass, artificial flowers, beads or small glass tubes filled with coloured liquids. The box should be only deep enough to enable the objects within it to fall freely, when gently shaken. When the tube is held to the light a circle of variegated pattern, divided into six sectors of like shape, is always visible, and every time that the tube is revolved, and the relative position of the objects in the box altered, a different pattern is observable. By placing a lamp behind the eyehole, when the tube is fixed horizontally, by setting there strong lenses, as in a magic lantern, and by replacing the ground glass at the base of the object-box by transparent glass, the kaleidoscopic pattern may be magnified and thrown upon a white screen. The number of equal sectors visible in the kaleidoscopic circle is determined by the angle of inclination of the mirrors. If the angle be less than 60° (*e.g.*, 30°), the number of equal sectors will be more than 6 (*e.g.*, 12). If the angle be greater than 60° (*e.g.*, 120°), the number of sectors will be fewer than 6 (*e.g.*, 3).

¶ The instrument which was perfected by Sir David Brewster in 1817 (although first invented, under the name of the *polyplatin*, by Baptista Porta, in the sixteenth century), is occasionally used by designers of patterns for carpets, wall-papers, or calico and other dress materials. It is also useful as a scientific apparatus for illustrating the optical problem of the multiplication of images produced by reflection, when the object is placed between two plane mirrors inclined at different angles. It has likewise been a favourite toy from the year of its invention, and 200,000 were said to have been sold in the toyshops of London and Paris in the two months succeeding that date (1817).

"In the *kaleidoscope* there really is that deception: when I look through the instrument, instead of what is actually there, namely, a casual arrangement of coloured fragments, the appearance presented is that of the same combination several times repeated in symmetrical arrangement round a point."—*J. S. Mill: Logic.*

Some varieties of the instrument are as follows:

(1) *Polyangular kaleidoscope:* Here the reflecting mirrors are so arranged that their angle of inclination can be altered by screws attached to the outside of the tube at pleasure, and it is in this form that the instrument best illustrates the theory of reflection, and therefore is largely used for scientific instruction.

(2) *Polycentral kaleidoscope:* Here more than two mirrors are employed, but not ordinarily more than four. They may be of trapezoidal shape, and form a hollow pyramid, or rectangular, forming a hollow cube. By this means the images produced by reflection of the objects in the box are greatly multiplied and more complicated patterns formed. Dr. Roget was the inventor of this instrument.

(3) *Telescopic kaleidoscope:* Here the object-box is removed and its place taken by a tube capable of being lengthened or shortened by an external screw, and fitted at its end with a double convex lens. The instrument can thus reflect any objects (trees, flowers, &c.) which are brought into its focus. It was invented by Sir David Brewster.

2. Variegated (like the patterns seen through the kaleidoscope).

Zoology:

I. The genus Macropus, and specially the Great Kaugaroo, *Macropus giganteus.* This species was the first known of the family, having been seen by a party of sailors whom Captain Cook sent ashore on the coast of New South Wales to seek fresh provisions for the sick on board his vessel. On their representations, Captain Cook and Mr. (afterwards Sir Joseph) Banks landed, and after a time a specimen was shot. (For its dentition, see Macropus and Macropodidæ.) The Great Kangaroo has large hind legs, with a huge tail, short fore limbs, and is about the height of a man. It is a vegetable feeder, and is destructive to the crops of the settlers in the less inhabited parts of Australia; in the long settled districts it is much rarer. Its chief foes are man and a native dog called the dingo. Its ordinary method of progression is by a series of great leaps, ten to fifteen feet or more. If when infuriated it can overcome an adversary it will seize him by its fore feet, hug him like a bear, and rip him with the claws of its hind feet, or (according to Gould, quoted by Duncan, *Nat. Hist.,* iii. 191), taking him to a water-hole, hold him under water till he is drowned. Many other species exist. The Hare Kangaroo or Turatt is *M. leporoides;* the Great Rock Kangaroo, *M. robustus;* the Red Kangaroo, *M. rufus;* the Agile Kangaroo, *M. agilis;* the Brush-tailed Rock Kangaroo, *M. penicillatus;* and the Tree Kaugaroo, *Dendrolagus ursinus.*

Kantian philosophy, *s.*

Hist. & Philos.: Critical philosophy. The name is applied to the writings of Immanuel Kant, probably the greatest metaphysician that ever lived, and to the various systems which have been developed from those writings. Kant, the son of a saddler of Scotch descent, was born at Königsberg, April 22, 1724; in 1770 he was appointed Professor of logic and metaphysic at the University of Königsberg; and in Königsberg he died on Feb. 12, 1804, after a singularly uneventful life. Kant, following the scepticism of Hume, as to the Idea of Causality, laid it down as a cardinal proposition that the faculty of Cognition and the sources of knowledge therein contained, must be critically examined before anything can be determined concerning the objects of cognition. His aim was, therefore—(1) To separate the necessary and universal in cognition from what is merely empirical; and (2) To define the limits of cognition.

Kant attributed to the faculties of Sense, Understanding, Judgment, and Reason certain innate *a priori* forms, possessing subjective validity on account of their subjective necessity—in the Sense, the ideas of Time and Space; in the Understanding the Categories—

Quantity—Unity, Multeity, Totality.
Quality—Reality, Negation, Limitation.
Relation—Substance and Accident, Cause and Effect, Action & Reaction.
Modality—Possibility, Existence, Necessity.

—in the Judgment the concept of Design; in the Reasou the ideas of the Unconditioned and the Absolute; and in the Will, or Reason, from an ethical point of view, the Categorical Imperative. [IMPERATIVE, ¶.]

In determining the limits of theoretical knowledge, Kant endeavoured to show that universal forms existing in the mind can only afford knowledge when the objects they cognize are presented by Experience, and even then, in any particular case, we are cognizant not of the thing-in-itself (*Ding an sich*), but only as it appears—of the *phænomenon,* not of the *noumenon.* The result is the abandonment of all claims to knowledge transcending experience in Psychology, Cosmology, or Theology. In this connection Wallace says:

"His point is, that though it is unquestionably necessary to be convinced of God's existence, it is not so necessary to demonstrate it. Going even further . . . he shows that all such demonstrations are scientifically impossible and worthless. On the great questions of metaphysics—Immortality, Freedom, God—scientific knowledge is hopeless."—(*Blackwood's Phil. Class.: Kant,* p. 188).

In Anthropology it is a noteworthy fact that "Kant had faced the idea of the evolution of man from a lower animal stage."

It occurs in many places in very extensive beds as an earthy powder, and is derived principally from the decomposition of the felspars of granites, granitic, gneissic, and felsitic rocks. It is extensively used in the manufacture of porcelain. The name kaolinite was applied by Johnson and Blake to a soft powder made up of minute, transparent, pearly scales, which is always present in greater or lesser quantity in all kaolin. They also pointed out the chemical and physical identity of the crystalline with the amorphous form.

3. *Porcelain Manuf.:* Kaolin, after being levigated, is used in the manufacture of porcelain. Hence it is called China clay. It is now largely used for that purpose in the United States and Europe.

¶ (1) To *preserve* is to *keep* with care, and free from all injury; to *save* is to *keep* laid up in a safe place, and free from destruction. Things are *kept* at all times, and under all circumstances; they are *preserved* in circumstances of peculiar difficulty and danger; they are *saved* in the moment in which they are threatened with destruction: things are *kept* at pleasure; they are *preserved* by an exertion of power; they are *saved* by the use of extraordinary means: the shepherd *keeps* his flock by simply watching over them; children are sometimes wonderfully *preserved* in the midst of the greatest dangers; things are frequently *saved* in the midst of fire by the exertions of those present.

(2) To *keep* is simply to have by one in such manner that it shall not depart; to *observe* is to *keep* with a steady attention; to *fulfil* is to *keep* to the end or to the full intent. A day is either *kept* or *observed;* yet the former is not only a more familiar term, but it likewise implies a much less solemn act than the latter; one must add, therefore, the mode in which it is *kept,* by saying that it is *kept* holy, *kept* sacred, or *kept* as a day of pleasure; the term *observe,* however, implies always that it is *kept* religiously: we may *keep,* but we do not *observe* a birthday; we *keep* or *observe* the Sabbath. Khus-khus tat: A mat or basket-like network made of the khus, used in dry weather in cooling an Indian bungalow. There blows in Central India in April, May, and part of June an intensely hot dry wind. When it sets in, Anglo-Indians take out the window-frames and open their doors, closing the gaps thus made with khus-khus tats. A native with a shovel, from time to time, takes up water from a pail and throws it at the khus-khus tat, most of the interstices of which are now closed with drops of water. As the thirsty wind enters the house through the drops, it takes up so much moisture as to become cool and agreeable. When at the approach of the rainy season, about the middle of June, the atmosphere becomes saturated with moisture, it no longer evaporates the drops, and the khus-khus tats are taken down.

Education: A system of education, for infants and young children, devised by Frederick Fröbel (1782–1852), by whom, in conjunction with M. Ronge, it was first carried out at Hamburg, in 1849. In 1851 Madame Ronge established a kindergarten at Hampstead. In 1858, Ronge published a work on the subject. Knowledge is imparted in an attractive form, chiefly by simple object-lessons, by toys, games, singing, and work—plaiting, weaving, folding, and cutting-out paper. Corporal punishment is excluded. The chief merit of Fröbel's method appears to lie in the fact that he makes education a real drawing-out, not a mere impartiug of instruction, which he considers as a means, not an end; his object is the unfolding of the child's whole nature with a view to free self-development and action. The Kindergarten system has been widely established in the United States, and in several cities it forms a part of the common school system. It has also been widely introduced in Great Britain.

¶ (1) *The First and Second Books of Kings:*

Old Test. Canon: Two books of the Old Testament, relating the history of the Hebrew monarchy (united and divided) from the proclamation of Solomon, a little before the death of David, to the death of Jehoiachim—a period not less than 431, and perhaps more than 453 years. In Hebrew, the two Books of Kings were originally one volume: the Septuagint divided them, calling them the third and fourth of the Kingdoms, and the Vulgate the third and fourth of the Kings. Next, Bomberg separated the Hebrew book into two, after the Greek model. The division is clumsily made in the middle of Ahaziah's reign, and with no important break in the historic narrative. There are resemblances so considerable between the books of Judges, Ruth, 1 and 2 Samuel, and 1 and 2 Kings, that some have supposed them a continuous narrative from a single author or editor; but there are sufficient differences between the books of Samuel and Kings to render it more probable that they were independent works. The unity of style between 1 and 2 Kings proves them to have had the same editor. The materials to which he had access for the composition of the book seem to have been governmental records, published histories of individual kings, with memoirs of Elijah and Elisha, not from a cold, official pen, but from an enthusiastic friend and admirer. The work contemplates events from the prophetic, as the books of Chronicles do from the priestly, point of view. The former gives prominence to the history of the Ten Tribes, among which most of the prophets labored; the latter to that of the Two Tribes, among whom the priests found their home. Both taught that the Jewish monarchy was a theocracy, with Jehovah for its real sovereign, and was prosperous or otherwise according as his earthly vicegerents carried out or departed from his commands. Keen study of the Books of Kings is needful to the comprehension of the Old Testament prophetic writings, which in their turn reflect great light on the historic narratives in Kings. Recent archæological

researches have afforded much confirmatory evidence in favour of the sacred narrative. It is believed that Shishak (1 Kings xiv. 25, 26), So, or Sevek (2 Kings xvii. 4), Tirhakah (xix. 9), and Pharaoh Nechoh (2 Kings xxiii. 29, 30), figure on the Egyptian monuments. The Assyrian account of Sennacherib's expedition against Hezekiah is on a little barrel-like cylinder, covered with arrow-headed characters, in the British Museum. Omri (1 Kings xvi. 16, 17, &c.); Jehu (2 Kings ix. 2, &c.), Menahem (xv. 14, &c.), Tiglath Pileser (xvi. 10), and Shalmaneser (xvii. 3), are also on the Assyrian tablets. There is a lengthened account of Mesha, the sheepmaster, on the Moabite stone (q.v.) (2 Kings iii. 4, 5). The Books of Kings, or narratives derived from them, are alluded to in many passages of the New Testament.

kingdom of heaven, kingdom of God, *s.*

Scripture & Theology:

1. A spiritual kingdom (Luke xvii. 21; John xviii. 36) which was "at hand" when John the Baptist announced the approaching advent of Jesus (Matt. iii. 2), and even after the ministry of the latter had commenced (Mark i. 15). The proper preparation for it was repentance (*ibid.*). Jesus preached its coming (Luke iv. 43, viii. 1, xvi. 16). After his miraculous power had been experimentally demonstrated and the evangelists gone forth, it had arrived (Matt. xii. 28; Luke x. 11). It was to advance from small beginnings, like a seed which germinates, grows, and bears fruit (Mark iv. 26–32). Commencing on earth, its full establishment was to be at the conclusion of the present age in the other world (Matt. xii. 24 to 50; Luke xiii. 28, 29, xxii. 16, 18). Before one could enter into the kingdom of God he must be born again (John iii. 3). The expression "kingdom of heaven" is the common one in Matthew, while kingdom of God is frequent in Mark and Luke.

kitchen-middens, *s. pl.*

Archæol.: Kjökkenmöddinger, refuse-heaps, or shell-mounds—the names given to what were formerly considered to he raised heaches on the coast of Denmark, hut which are now proved to have heen deposited hy early man. It was first observed hy Prof. Steenstrup that, in these supposed heaches, the shells helouged entirely to full-grown or nearly full-grown individuals; that they consisted of four species—the oyster, the cockle, the mussel, and the periwinkle—which do not live together, nor require the same conditions, and would not therefore be found together alone in a natural deposit; and, thirdly, that the stratum contained scarcely any gravel, but consisted almost entirely of shells. The discovery of flint implements and of bones hearing the marks of knives made it evident that these heds were the sites of ancient villages, the population of which lived principally on shellfish, but partly on the produce of the chase. A committee was formed, consisting of Professors Steenstrup, Forchhammer, and Worsaae, who examined a large number of these deposits, collected many thousand specimens, now in the Museum of Northern Antiquities at Copenhagen, and embodied the result of their labours in six reports to the Danish Academy of Sciences. Sir John Lubhock ohtained from a kitchen-midden at Haveloe in 1861 "about a hundred fragments of bone, many rude flakes, slingstones, and flint fragments, together with nine rude axes of the ordinary shell-mound type;" and he was even more successful in his visit to the Midden at Meilgaard in 1863. Kitchen-middens are hy no means limited to Denmark. They exist on the shores of the Moray Frith, at St. Valéry, close to the mouth of the Somme; in Cornwall and Devonshire, in Australia (*Pinkerton: Travels*, ii. 473), in Tierra del Fuego (*Darwin: Journal*, p. 234), in the Malay Peninsula (*Ethnol. Soc. Trans.* (n. s.), ii. 119), and in North (*Wyman: American Naturalist*, vol. ii., Nos. 8, 9, 11) and South America (*Brett: Indian Tribes*). (*Lubbock: Pre-historic Times*, ch. vii.)

The following is a list of the remains of vertebrata discovered in the shell-mounds:—

Fishes.—Herring, dah, dorse, eel.
Birds.—Capercailzie, several species of ducks and geese, the wild swan, and the great auk, now extinct.
Mammals.—Stag, roedeer, wild boar these three forming 97 per cent. of the whole; urus, dog, fox, wolf, marten, otter, porpoise, seal, water-rat, heaver, lynx, wild cat, hedgehog, hear, and mouse.

With regard to the time when these kitchen-middens were formed, Sir John Lubbock (*loc. cit.*) says: "On the whole, the evidence appears to show that the Danish shell-mounds represent a definite period in the history of that country, and are probably referrible to the early part of the Neolithic Stone Age, when the art of polishing flint implements was known, hut before it had reached its greatest development."

It consists in the construction of a looped fabric in which for the first row a succession of loops are cast on or preferably knitted on to a needle, and in succeeding rows each loop is passed through the loop of each succeeding row. It differs distinctly from braiding, netting, and weaving, which is, perhaps, the order of invention, knitting being centuries later than either of the others.

Mech.: An apparatus for mechanically knitting jerseys, stockings, and other knitted goods. There are many kinds of machine: one of the most popular is the Bickford knitting-machine, which is on what is known as the circular system. A bed-plate having a vertically projecting and grooved needle-guiding cylinder or bed is secured to a table or other suitable support. On the bed-plate is a loose ring, provided with a thread-guide for conducting the thread to the needles, and about the needle-cylinder is a revolving cylinder, having an annular groove interrupted by a cam portion, and provided with adjustable cams, which govern the downward motion of the needles, and consequently the length of the loops, and raise the needles; and two of these latter cams are needed to provide for reversing the machine for knitting the heel or a flat web. The cam-cylinder is moved by a bevel gear connected to a driving-crank, and when moved continuously in one direction knits a circular web; and this web may be narrowed as desired, to fashion the leg, by removing needles, and placing their loops on adjacent needles. One needle receives the thread within its hook, and is subsequently moved by the cam-cylinder so as to form the thread so taken into a loop. When the heel is to be formed, a portion of the needles are drawn up, thus retaining their loops, and the number of needles left in action correspond with the width of the heel to be formed. The cam-cylinder is now to be reciprocated in opposite directions, and in order to keep the thread-guide in advance of the descending needles sufficiently far, so that the thread will be caught, pins are inserted in the bed-plate, and engage the heel of the thread-carrier, and stop it just before the cam-cylinder is stopped.

(*Sale.*) The verse runs thus:—

"God, there is no God but He, the living, the self-subsistent. Slumber takes him not, nor sleep. His is what is in the heavens and what is in the earth. Who is it intercedes with Him save by His permission? He knows what is before them and what behind them, and they comprehend not aught of his knowledge but of what he pleases. His throne extends over the heavens and the earth, and it tires Him not to guard them both, for He is high and grand."

Professor Palmer (*Sacred Books of the East,* vi. 40), says it is "considered one of the finest passages in the Qur'ân, and frequently found inscribed in mosques and the like." Sale (note *in loc.*), says that "Mohammedans recite it in their prayers, and some of them wear it about them engraved on an agate or other precious stone."

Religions: The Muhammadan scriptures, which professedly consist of revelations made by Allah (God) to Muhammad, the medium of communication being the angel Gabriel. When a Mussulman quotes from them, the formula he uses is not "Muhammad says," but "God says." He calls the book the Book of God, and the Word of God, or the Book. [Bible.] Muhammad, who gloried in being the "illiterate prophet," wrote nothing himself, yet his followers noted down his utterances on leather, palm-leaves, stones, and even the shoulder-blades of sheep. His companions also preserved much by oral recitation.

The Koran is not so large as the Bible. It is divided into 114 suras, or chapters, not arranged chronologically. For instance, chapter i. was "given at Mecca;" ii., at Medina; iii., at Medina; lxvi., at Medina; lxvii.-cxiv. at Mecca. Indeed, there seems to be no arrangement of any kind in the book; its chapters are as inconsecutive as if they had been a series of sibylline leaves blown into their places by the wind. The chapters are named as well as numbered; thus, ch. ii. is denominated "the Cow;" ch. v., "the Table;" lxxxvi., "the Night-star." The work consists of moral, religious, civil and political teachings, commingled with promises, threatenings, &c., to be fulfilled in the future world; with Biblical narratives, Arabic and Christian traditions, &c. Later revelations sometimes revoked or essentially modified those which had gone before. The Caliph Abu Beker, or Bacr, directed Zeid ibn Thorbit to collect the scattered utterances of the Koran. Afterwards there was a revision by the Caliph Othman, various readings having already arisen. He left it in the form in which we find it now. It has been translated into most European languages. Sale published an English version of it in 1734. [Muhammadanism.]

Hindoo Myth.: The eighth avatar (incarnation) of Vishnoo. Kansa, a demon-king of Mathura, having ruled oppressively, the Brahmans supplicated Vishnoo to interfere. He, in reply, plucked off two hairs, one black, the other white; the former became Krishna. He was born at Mathura; his father was Vasudeva, a kshatriya (warrior), and his mother Devaki. Kansa seeking to destroy him when an infant, his father fled away with him, and hid him in a vaisya's (merchant's) shop. When eight years old it rained heavily, and the god rooted up a mountain, and obligingly held it as an umbrella over the heads of the villagers and their cattle. When a youth he sported with sixteen thousand milkmaids in the wilderness of Bindrabun. Next assuming four arms, he killed the tyrant Kansa. He married two wives, but his favourite was a mistress called Radha. According to Mr. Ward, about three-fifths of the whole Hindoo population of Bengal are worshippers of this god, and various festivals are held in his honour. He is also worshipped in other parts of India. He is generally represented as a black man, holding a flute to his mouth with both hands, sometimes with his favourite Radha standing on the left. He may have been an historical personage, around whom multitudinous myths have gathered.

L.

L, The twelfth letter of the English alphabet, is generally regarded as a semi-vowel or a liquid. In shape it has been derived from that of the Oriental *lamed*. *L* has only one sound in English, as in *love, long, like*, &c. It is formed by placing the tip of the tongue against that part of the gum which incloses the upper teeth, and allowing the breath to escape by the sides of the tongue. *L* is frequently interchanged with *r*, of which it is considered to be a later modification: thus the Latin *lavendula* has become in English *lavender;* the Latin *peregrinus* (Fr. *pelerin*) has become the English *pilgrim;* the Latin *sinoplum*, English *sinoper*. *L* has become *n*, as in *postern*, Lat. *posterula* (O. Fr. *postcrle, posterne*). In some Romance words it has been weakened to *u*, as in *hauberk* = O. Fr. *halberc, halbert; auburn* = Lat. *alburnum*. From several words it has disappeared, as from *each* = A.S. *ælc; which* = A.S. *hwylc; such* = A.S. *iwylc; as* = = A.S. *ealswa* (*also*). On the other hand it has intruded into *could* = A.S. *cuthe, coude; myrtle* = Lat. *myrtus; manciple* = O. Fr. *mancipe*, Lat. *mancipium; participle* = Lat. *participium; syllable* = Lat. *syllaba*. *L* is frequently doubled at the end of monosyllables, as *fall, ball, bell*, &c., but not after diphthongs or digraphs, as *foul, foal*, &c. In A.S. *l*, like *r*, was frequently preceded by *h*, which has since been dropped, as in *loaf* = A.S. *hlâf; lot* = *hlot*, &c. In the final syllable *-le* of English words the *e* is silent, and *l* forms a syllable by itself, as in *able, table*, &c. In many words the *l* has now become silent as in *walk, talk, half, calf*, &c.

The Labadists then formed a small settlement near Amsterdam, but were obliged to move thence to Erfurt, and afterwards to Altona, where Labadie died Feb. 16, 1674. Min.: A member of the Felspar group (q.v.), in which the protoxide bases are lime and soda, the sesquioxide base being alumina. Crystallization, triclinic; independent crystals, however, are rare. Twin habit very common, the repetition of one form of twin producing a lamellar structure. Cleavages, three; the first very distinct, the second less so, of the third only traces. Lustre on principal cleavage pearly, passing into vitreous; elsewhere vitreous or sub-resinous. Hardness, 6; sp. gr., 2·67–2·76; fracture imperfectly conchoidal; streak white; translucent. Doubly refracting, optical properties, analogous to those of albite and anorthite (q.v.), but much obscured by the pressure of twin lamellæ. Colors, gray, brown, greenish; sometimes colorless. The cleavable massive varieties sometimes exhibit, in the direction of the second cleavage, a lively play of color, blue and green predominating, but fire-red and yellow also occur. This phenomenon has not yet received a satisfactory explanation. It is most marked in that from Labrador, which also frequently includes numerous excessively thin, minute crystals, which have been referred to göthite and hæmatite. It forms an essential constituent of many rocks, in which it is associated with hornblende, augite, diallage, or hypersthene, also in many modern lavas; in distinct crystals in those of Etna and Vesuvius. The colored varieties are sometimes used in jewellery. Called also Labrador-felspar.

Palæont.: In Prof. Owen's classification, the second order of the class Reptilia or Reptiles. Now that the Amphibia are quite separated from the Reptiles, the Labyrinthodonts are placed with the former class. They had an elongated body furnished with a tail. Most had palatine and vomerine teeth. As a rule the dentine was much folded (hence their names). There were three thoracic plates, and a ventral armour of small scutes. The limbs were four, usually, or at least often, pentadactyle. Their closest affinity was not, as was once believed, with the Batrachians, but with the lower members of the class Amphibia. They could not leap like frogs. They have been found in England, Scotland, Ireland, Germany, Russia, Central India, South Africa, Australia, and North America. They occur from the Carboniferous to the Jurassic periods. They frequented fresh water, and were wholly aquatic in the first stage of their development. The Labyrinthodonts have been divided into ten sub-orders, groups, or families: (1) Euglypta, (2) Brachyopina, (3) Chauliodonta, (4) Athroodonta, (5) unnamed, (6) Archegosauria, (7) Heleothrepta, (8) Nectridea, (9) Aïstopoda, and (10) Microsauria. (See these words.) (*Rep. Brit. Ass. for* 1873, pp. 225–247; 1874, pp. 149–192.)

1. *Botany, &c.:*

(1) A resinous encrustation caused by the parasitic insect *Coccus Lacca.* The encrusted sticks are called Stick-lac. If broken off from the twigs, and washed in water, the resin breaks into small particles called Seed-lac; and, if this be melted over a fire, and squeezed through a long sac into troughs, it spreads out into thin flakes, Shell-lac; if dropped into rounded masses, it is Button-lac; if into larger pieces, it is Sheet-lac or Piece-lac. (*Prof. Watt.*) Lac is called also East Indian Kino.

(2) A white, orange, or other-coloured fluid occurring in many plants. (*Treas. of Bot.*)

(3) A gummy substance produced by *Alectrites lac.* (*Treas. of Bot.*)

3. A kind of network of threads of flax, cotton, gold or silver wire, or other suitable material, forming a fabric of transparent texture. Its origin is not known, but it appears to have been used by the ladies of ancient Greece and Rome. It was early used in Northern Italy, and is said to have been introduced into France by Mary de Medicis. In 1483 its importation into England was prohibited. Point lace was embroidered with the needle. Bone lace (Charles I.) was a kind

of thread lace, and received its name from the bobbin being made of bone. About 1768, a stocking-weaver of Northampton produced a machine for making lace; it was called the pin-frame, and is still employed in France for making the lace called tulle. In lace-weaving, the threads of the weft are twisted round those of the warp. The manner of twisting determines the character of the net and its name, as whip-net, mail-net, pattern-net, drop-net, spider-net, balloon-net, Paris-net, bobbin-net.

The following is a list of the classified laces:

(1) Pillow-lace, the article or fabric being wholly made by hand (known as Valenciennes, Mechlin, Honiton, Buckingham); or Guipure made by the crotchet-needle; and silk lace, called blonde when white, and Chantilly, Puy, Grammont, and black Buckinghamshire, when black.

(2) Lace, the ground being machine-wrought, the ornamentation made on the pillow and afterwards applied to the ground (known as Brussels, Honiton, or appliquée lace).

(3) Machine-made net or quillings, wholly plain, whether warp or bobbin (known as bobbin-net, tulles, blondes, Cambrai, Mechlin, Brussels, Alençon, &c.).

(4) Lace, the ground being wholly made by machine, partly ornamented by machine, and partly by hand, or wholly ornamented by hand, whether tamboured, needle-embroidered, or darned.

(5) Lace, wrought and ornamented by machinery, comprising trimming laces of every description, veils, falls, scarfs, shawls, lappets, curtains, &c.

lace-bark, *s.*

Botany:

1. The inner bark of *Lagetta lintearia*, one of the Daphnads. The English name is given because the bark, when macerated and stretched laterally, resembles coarse lace, and in Jamaica, where the tree grows, is made into caps, ruffles, &c. The negroes make durable clothing from it, and the white inhabitants utilize it for ropes and cables. The tree was introduced into British hothouses, in 1844, by Mr. Wilson, Curator of the Botanic Garden at Bath. In its native country it grows on marly limestone, where there is not a particle of earth to be seen.

2. The name given in New Zealand to the genus Philippodendron.

lactic-acid, *s.*

Chem.: $C_3H_6O_3 = CH_3{\cdot}CH{\cdot}(OH){\cdot}CO{\cdot}OH$. A monobasic, diatomic acid, discovered by Scheele in sour milk, and first recognised as a distinct acid by Berzelius. It occurs in small quantity in the animal organism, especially in the gastric juice, and, under certain circumstances, is formed in the fermentation of some sugars. It is readily prepared by adding to a solution of grape sugar a small quantity of powdered old cheese, mixed with sour milk, and allowing the mixture to stand for eight or ten days at a temperature of 40° to 45°. It may also be prepared synthetically by mixing ethylideue oxide or acetic aldehyde with hydrocyanic acid, and treating the resulting product with hydrochloric acid, the ethylidene hydrate cyanide first formed being converted into lactic acid even at the ordinary temperature. It is a colourless, inodorous liquid of syrupy consistence, possessing an intensely sour taste. It is soluble in all proportions in water and alcohol, slightly soluble in ether. Its sp. gr. is 1·215 at 20°, and it does not solidify even at −24°. When boiled with nitric acid, it is converted into oxalic acid, whilst hydrocyanic acid reduces it to propionic acid. Lactic acid forms salts by the replacement of hydroxylic hydrogen by metals. The neutral alkali salts are deliquescent, and soluble in alcohol. Sodic lactate, $CH_3{\cdot}CH(OH)CO{\cdot}ONa$, crystallizes in fine, hair-like crystals. Calcic lactate, $(CH_3{\cdot}CH(OH)CO{\cdot}O)_2Ca{\cdot}5H_2O$, crystallizes in small, thin needles, soluble in water and alcohol. Zincic lactate, $C_6H_{10}ZnO_6{,}3H_2O$, is the most characteristic salt of lactic acid. It crystallizes in colourless, monoclinic prisms, slightly soluble in cold water, very soluble in boiling water, but insoluble in alcohol.

Ethylic lactate, $CH_3{\cdot}CH{\cdot}(OH){\cdot}CO{\cdot}O{\cdot}C_2H_5$, is formed by heating to 170°, in a sealed tube, a mixture of lactic acid and alcohol. It is a colourless liquid of peculiar odour, and boils at 186°. Water, alcohol, and ether dissolve it in all proportions, but it is difficult to obtain it in the crystalline form. Monethylic lactate is a colourless liquid, boiling at 150°. It is soluble in water, alcohol, and ether. Diethylic lactate, $C_7H_{14}O_3$, produced by the action of ethylate of sodium on chloropropionate of ethyl, is a transparent, mobile liquid of an agreeable odour, insoluble in water, but soluble in alcohol and ether. It boils at 156°·5, and has a sp. gr. of 0·9203 at 0°.

Chem.: A minute organism which, under the microscope, is seen to consist of small elliptical cells, generally detached, but sometimes occurring in chains of two or three. It is developed in milk, when it is allowed to staud for some time, and is the cause of the milk becoming sour, the sugar of the milk changiug into lactic acid. It is also developed when cheese is added to a solution of sugar, and kept at a temperature of 35° to 40°.

A species of hydrometer, graduated to show the comparative specific gravity and consequent value of different samples of milk. The instrument is a good evidence of the specific gravity of milk, and the specific gravity is a probable, but not positive, evidence of quality. Taken in connection with the per-cent. glass, which measures the per cent. of cream that rises, it is nearly a positive indicator of pure and watered milk. One form of the lactometer for ascertaining the amount of cream in milk consists of a tube with a funuel mouth for convenience in charging it, and having the upper portion graduated. The tube is about a foot in length, and, being filled, the cream is allowed to rise, when its richuess is determined by the uumber of graduated spaces occupied by the cream.

The seeds yield a clear, transparent sweet oil. It yields the narcotic drug, lactucarium, the best of which, however, comes from *L. altissima*. The extract of *L. virosa*, the strong-scented lettuce, is a mild sedative, anodyne, and antispasmodic. It is useful in phthisis, bronchitis, asthma, rheumatism, spermatorrhœa, and dropsy. *L. It contains 52·6 per cent. carbon, 6·8 hydrogen, and 36·6 oxygen, agreeing nearly with the formula $C_{20}H_{32}O_{10}$, and is therefore produced from lactucin by assumption of water and oxygen. (*Watts: Dict. Chem.*, iii. 465.)

Chem.: $C_6H_{10}O_5$. An uncrystallizable syrup obtained by heating lævulose to 170°. It may also be prepared by heating cane sugar to 160°, and keeping it at that temperature for four hours. A mixture of equal parts of lævulosane and dextro-glucose is produced, but the latter may be easily removed by fermentation. It is soluble in water and diluts spirit, but insoluble in absolute alcohol. Its solution has a dextro-rotatory power $(a)_J = 15°$ or $(a)_H = 13·5°$. When boiled with water and dilute acids, it is converted into lævulose. On oxidation it yields saccharic acid.

lævˊ-ų-lōse, *s.* [Lat. *lævus* = the left; *l* connective, and Eng. suff. *-ose.*]

Chem.: $C_6H_{12}O_6$. Lævo-glucose, or sncro-lævulose. A variety of sugar, isomeric with dextrose, occurring together with dextrose in honey and in the juices of sweet fruits. It is also produced, together with an equal weight of dextrose, by the action of dilute acids, diastase, or yeast, on cane-sugar; or it may be obtained pure by heating inuline with

dilute acids. It is a colourless, uncrystallizable syrup, or, when dried at 100°, a gummy, deliquescent mass, soluble in water, and in spirit 50 o. p., but insoluble in absolute alcohol. It closely resembles dextrose in many of its characters, but its aqueous solution is sweeter, and it is more easily altered by heat and acids. Its specific rotatory power is −98°, at 15° for the D line, decreasing with the rise of temperature. When powdered, slaked lime is added gradually to a solution of lævulose in ice-cold water, calcium lævulosate, $C_6H_{12}O_6{\cdot}CaO,H_2O$, soluble with difficulty, is formed. By means of this reaction, lævulose can be readily freed from dextrose; the latter, on similar treatment, yielding a freely-soluble compound.

Surrey: Virgile; Æneis iv.

2. *Geol.:* As Professor (now Sir Andrew) Ramsay first pointed out in 1862, many lakes are of glacial origin, an hypothesis illustrated by the fact that on a map of the world it is chiefly northern lands like Scotland, Scandinavia, or the more Arctic parts of Russia, Canada, and mountain-lands like Switzerland and the north of Italy that are characterized by the presence of lakes. Others are of volcanic or earthquake origin. Thus in the Mississippi earthquake of 1811 large lakes of twenty miles in extent were formed in an hour. The molluscs in lakes are few in genera and species, though often numerous in individuals; none of the univalves have channelled mouths. Lacustrine strata of ancient date have the same peculiarities.

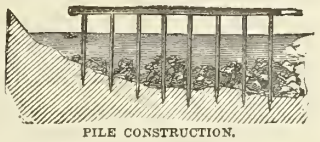
lake-dwelling, *s.* & *a.*

A. *As substantive:*

Anthrop. (*Pl.*): The *Pfahlbauten* of German, the *habitations lacustrines* of French writers. The earliest account of similar dwellings is to be found in Herodotus (*Terps.* v. 14), who describes a Thracian tribe living, in 520 B.C., in a small mountain-lake of what is now Roumelia. The custom of constructing these habitations has come down to the present day. The fishermen of Lake Prasias, near Salonica, still inhabit wooden cottages built over the water, as the Thracian tribes did, and in the East Indies the practice of building lake-settlements is very common. (For authorities, see *Lubbock: Pre-historic Times* (1869), ch. vi.) It will be convenient to treat (1) of the Swiss and Italian lake-dwellings (*Pfahlbauten*), and (2) of craunoges (*Packwerkbauten*).

1. The lake-dwellings proper of Switzerland came to light during the winter-months of 1853–4, when the water of the lakes fell much below its ordinary level, and first in a small bay between Ober Meilen and Dollikon, on the Lake of Zurich. Traces of lake-dwellings have since been found in most of the large Swiss lakes, as well as in several of the smaller ones; at Peschiera, on the Lago di Garda; in Mecklenburg, at Abbeville, and at Thetford. Some are referable to the Stone, others to the Bronze Age, the former preponderating in the eastern lakes, as Constance and Zurich; the latter in Western and Central Switzerland. Dr. Keller, who first described these lakes, says that the main platform was of round timbers, rarely of split boards, covered with a bed of mud; the walls and sides were in great measure of interlaced branches, the interstices filled with moss, and daubed with clay. In his opinion, all the evidence goes to show they were rectangular in shape. It is probable that the huts were thatched, and the parts used as dormitories strewn with straw or hay. M. Troyon (*Sur les Habitations Lacustrines*) thinks they were round, as were the huts of many nations on the shore. It has not been ascertained whether the huts were divided into rooms, or whether they contained a single chamber. Keller (*Lake-dwellings of Switzerland* (ed. Lee), p. 3) distinguishes three modes of construction:—

(1) *Pile:* The platform laid on piles driven into the mud at regular interval, the spaces between the piles being filled up with stones, to give solidity to the structure. Keller's



PILE CONSTRUCTION.

translator notes that a somewhat similar process was adopted at Portland Breakwater.

(2) *Frame-pile:* A comparatively rare form, known to have existed in the Lake of Zurich, and possibly in other places. The piles to support the platform were fixed by a mortise and tenon arrangement into split trunks, lying horizontally on the bottom of the lake. This plan was chiefly followed where the bottom of the lake was of soft sand, giviug no hold for the piles. Timbers, similar to the one here reproduced are known to be at the bottom of several of the Swiss lakes, so that this mode of construction may have been widely spread.

(Dredged from the Lake of Zurich.)

(3) *Fascine:* Here the necessary foundation for the platform was obtained by layers of sticks, or the stems of small trees. (The chief authorities are Keller, *op. cit.;* Dr. Heer (*Die Pflanzen der Pfahlbauten;* Rütimeyer (*Die Fauna der Pfahlbauten*).

2. *Crannoges:* Artificial islands found principally in Ireland, where they served the purpose of strongholds. In this case "the support consisted not of piles only, but of a solid mass of mud, stones, &c., with layers of horizontal and perpendicular stakes, the latter serving less as a support, than to bind the mass firmly together" (*Lubbock: Pre-historic Times* (1869), p 174). They are of much later date than the lake-dwelling proper, some being depicted in Johnson's "Platt of the County Monaghan," a map of the escheated territories made for the English Government in 1591.

"In 1863 Lord Lovaine described a *lake-dwelling* observed by him in the south of Scotland."—*Lubbock: Pre-historic Times* (1878), p 181.

B. *As adj.:* Found in, belonging to, or in any way connected with the dwellings described under A.

"This may be a suitable place for mentioning the mode in which *lake-dwelling* antiquities are collected."—*Keller: Lake-dwellings of Switzerland* (ed. Lee), i. 9.

[LAKERS.]

lake-settlement, *s.*

Anthrop.: A collection of lake-dwellings. Lyell (*Antiq. Man* (1873), p. 21), says: "It is believed that as many as 300 wooden huts were comprised in one settlement, and that they may have contained about 1,000 inhabitants."

lake-weed, *s.*

Bot.: Polygonum Hydropiper.

lake-worship, *s.*

Comp. Religions: A particular kind of water-worship noticed by Sir John Lubbock (*Pre-historic Times* (1869), p. 269) to refute a theory that the gold ornaments dredged up from the sites of lake-dwellings were offerings to the gods. That certain lakes were held sacred by ancient nations is indisputable. Tacitus, describing the worship of Herthus (or Hertha), gives cogent reasons (*Ger.* xi.) why more particulars were not obtainable in his day:—

"Servi ministrant, quos statim idem lacus haurit. Arcanus hinc terror, sanctaque ignorantia, quid sit id, quod tantum perituri vident."

The following authorities may also be consulted: Cic., *in Verr.*, v. 72, *de Nat. Deor.*, iii. 20, 30; Mart., i. 50, ix. 59; Ovid., *Met.* v. 405, 406.

Paint.: The generic name of a variety of transparent red and other pigments of great beauty, prepared for the most part by precipitating coloured tinctures of dyeing drugs upon alumina and other earths, &c. The lakes are hence a numerous class of pigments, both with respect to the variety of their appellations and the substances from which they are prepared. The colouring matter of coumon lake is Brazil wood, which affords a very fugitive colour. Superior red lakes are prepared from cochineal, lac, and kermes; but the best of all are those prepared from the root of the *Rubia tinctoria* or Madder-plant.

la'-ma (2), *s.* [LLAMA.]

La'-ma-ism, *s.* [Eng. *lama*; *-ism.*]

Compar. Religions: A system partly religious, partly political—the Church and State Establishment of Tibet—standing in the same relation to Booddhism proper as Roman Catholicism stands to primitive Christianity. It has also been defined as a "form of Booddhism, modified by Saivism and Shamanism." Booddhism was introduced into Tibet in A.D. 622 by Srong Tsan Kampo, who founded the present capital, now known as Lhasa. His zeal was now shared by his two queens, one named Bribsoon, a princess from Nepâul, the other Wen Ching, a princess from China, who are said to have founded La Branq and Ra Mochay, the most famous religious houses in Tibet. From the death of this king down to about 850 is called the "First Introduction of Religion." More than a century of civil war followed, and in 971 there took place the "Second Introduction of Religion" into Tibet. For more than 300 years Booddhism grew in power and wealth, and Kublai Khan embraced the doctrine of the Lamas. Under his successors the dignity of abbot at Sakya became hereditary, the abbots breaking the rule of celibacy. In 1390, Tsongkapa, the Tibetan monastic reformer, appeared in Lhasa, and at his death, in 1419, he left three immense monasteries with 30,000 monks. The two things on which he insisted were, (1) the observance of celibacy, and (2) simplicity in dress. About the middle of the fifteenth century, the Emperor of China acknowledged the leaders—the Dalai Lama and the Pantshen Lama—as titular overlords of the Church and tributary rulers of Tibet. They were abbots of the monasteries at Gedun Dubpa, near Lhasa, and Krashis Lunpo in Further Tibet, and their successors still exercise the same rights. Both are looked upon as incarnations—living in heaven, and appearing on earth in an apparitional body. When one dies he is supposed to become incarnate in some male child born about that time. There is a hierarchy corresponding in a marked degree to that of the Roman Church, and Huc & Gabet describe the principal act of religious worship as wonderfully like a high-mass. The political authority of the Dalai Lama is confined to Tibet, but he is head of the Booddhist Church throughout Mongolia and China. (*Rhys Davids*, in *Encye. Brit.*)

The most circumstantial account that has come

down to us is to be found in Philostratus (*de Vita Apol.*, lib. iv.), where Lycius is said to have fallen in love with one of these spirits, but was delivered by his master Apollonius, who, "by some probable conjectures, found her out to be a serpent, a lamia." lănce, *s.* [Fr., from Lat. *lancea*; cogn. with Gr. λόγχη (*longchē*) = a lance.]

I. *Ordinary Language:*

1. A weapon consisting of a long shaft with a sharp point, much used, particularly before the invention of firearms. It is a thrusting weapon used on foot, but chiefly on horseback. In the Middle Ages the lance was held in the highest repute by knights and men-at-arms who formed the main strength of European armies; it was gradually superseded by the invention of gunpowder. The lance used by knights of the Middle Ages was of a peculiar form. Near the lower end the lance was very thick, with a deep opening in which the arm was placed when the lance was put in rest preparatory to a charge. Immediately in front of the opening the shaft was, in tilting-lances, from a foot to a foot and a half in diameter, and sloped off towards the upper end, which was from a half to three-quarters of an inch in diameter. The lances now in use among the European cavalry have a shaft of ash or beech-wood from 8 to 16 feet long, with a steel point 8 or 10 inches long, and to prevent this from being cut off by a sabre stroke, the shaft is guarded by a strip of iron on each side from one and a half to two feet long. The other end has an iron cap to prevent splitting. The point has a small pennon, intended to frighten the enemy's horses. When not in use, the lance is carried in a leathern shoe by the right stirrup, dependent by a leathern thong on the right arm. In use, it is carried under the right arm.

¶ Lancers were introduced into European armies by Napoleon I., after the pattern of those in the Polish service. After the campaign of 1815, four regiments of English lancers were formed from the 9th, 12th, 16th, and 23rd Light Dragoons. These are now represented by the 5th, 9th, 12th, 16th, and 17th Cavalry regiments, and are classed as the Medium Cavalry. They are armed with lance, sword, and pistol, but it is proposed to add a carbine. They are not good for reconnoitring purposes, as they are more easily seen than the Light Hussars, and are also very unsuitable to wooded country; but they are valuable in open country against infantry in disorder. The Uhlans in the German service are armed and used as in England, and are "medium cavalry."

(1) *English Law:* A generic term comprehending every species of ground or earth, as meadows, pastures, woods, moors, marshes, waters, furze, and heath, and includiug also messuages, lofts, crofts, mills, and buildings.

"*Land* includes in its signification any ground, soil or earth whatsoever; as arable, meadows, pastures, woods, moors, waters, marshes, furzes, and heath. Water being here mentioned as land, may seem a kind of solecism; but such is the language of the law: and therefore I cannot bring an action to recover possession of a pool or other piece of water by the name of water only: but I must bring an action for the land that lies at the bottom, and must call it twenty acres of *land* covered with water. For water is a movable, wandering thing, and must of necessity continue common by the law of nature; but the *land*, which that water covers, is permanent, fixed, and immovable; and of this the law will take notice, but not of the other. *Land* has also, in its legal significations, an indefinite extent, upwards as well as downwards. *Cujus est solum, ejus est usque ad cœlum*, is the maxim of the law, therefore no man may erect any building, or the like, to overhang another's *land;* and downwards, whatever is in a direct line between the surface of any *land* and the centre of the earth, belongs to the owner of the surface."—*Blackstone: Comment.*, bk. ii., ch. 2.

"We'll meet and aye be fain,
In the *land o' the leal.*"
Lady Nairne: Land o' the Leal.

¶ *Land* signifies an open, even space, and strictly refers to the earth. *Country* signifies *lands* adjoining so as to form one portion. The term *land*, therefore, properly excludes the idea of habitation; the term *country* ex-

cludes that of the earth, or the parts of which it is composed: hence we speak of the *land*, as rich or poor, according to what it yields; of a *country*, as rich or poor, according to what its inhabitants possess. The word *land* may sometimes be put for any portion of *land* that is under a government: as, the *land* of liberty; the *country* may be put for the soil; as, a rich *country*. (*Crabb: Eng. † land-end, *s.* (See extract.)

"One man had over and above his statutable wages certain food and drink 'and a *land-end* of grasse beside.' We are surprised that Mr. Atkinson does not explain what a *land-end* means. Its interpretation will not come by the light of nature to any one who has not dwelt where *land-ends* exist, and we feel pretty confident that the word is not to be found in the popular dictionaries. We ourselves are not quite certain of its meaning here. There were two significations which it bore in parishes where there had been no enclosure. Sometimes it meant a small portion of land or narrow strip of ground severed from the rest by a road or pathway; at others that part of an open field where, in ploughing, the horses or oxen turn, which is, consequently, ploughed last, and in a direction transverse to the rest of the field. *** lande,** *s.* [Fr.] A heathy and sandy plain unsuited for bearing grain.

¶ From the vast extent of landes (about four-fifths of the total area) which it contains, the third department of France, in point of

size, derives its name. The landes lie to the north of the Adour, while the country to the south of that river is fertile. The northern portion consists of heath, with occasional clumps of trees and brushwood, or of morasses, lagoons, and shifting sands. Of the whole area (about 2,250,000 acres), nearly one-half is waste a third under wood, and little more than a sixth arable. Buffaloes abound in the reedy swamps, and herds of wild horses roam over the heaths. In the more secluded and desolate tracts the inhabitants have peculiarities both of dress and living which give them a strong resemblance to half-savage and nomadic tribes. The landes are very thinly populated, the inhabitants gaining a miserable subsistence by fishing, by such agriculture as is possible, and by keeping cows and sheep. The shepherds make use of stilts, that their increased height may give them a greater range of vision, and, when fatigued, sit on a pole with a head somewhat like that of a crutch, and while away the time in knitting.

lăn'-guage (uage as wĭj), * lang-age, *s.* [Fr. *langage,* from *langue;* Lat. *lingua* = the tongue; Sp. *lenguage;* Ital. *linguaggio.*]

I. *Ordinary Language:*

1. Human speech; the aggregate of those articulate sounds, called words, used to express perception and thought, accepted by and current among any community; the expression of thought by articulate sounds or words; the body of uttered and audible sounds by which, in human society, thought is expressed.

"*Language* may be briefly and comprehensively defined as the means of expression of human thought. *Language,* then, signifies rather certain instrumentalities whereby men consciously and with intention represent their thought, to the end, chiefly, of making it known to other men: it is expression for the sake of communication. The instrumentalities capable of being used for this purpose, and actually more or less used, are various; gesture and grimace, pictorial or written signs, and uttered or spoken 'signs.'"—*Whitney: Life & Growth of Language,* ch. 1.

2. A particular set or aggregate of articulate sounds or words peculiar to a particular race, nation, tribe, or community; as, the *English* language, the *French* language, &c.; each of these often presents local varieties, to which the name of dialects has been given: Languages are divided according to two principles: first, morphologically, according to the structure of the language and the manner in which the sounds are formed or combined; and secondly, genealogically, according to their connection and relationship with respect to origin. The first class consists of three subdivisions of language, denominated *isolating, agglutinating,* and *inflectional. Isolating* languages, of which Chinese is an example, consist entirely of monosyllabic, unchanging roots. The Scythian is the type of what is called an agglutinative structure, in which the root maintains itself unaltered in the whole group of derivatives and inflections, and each suffix has an unchanged form and office. The Basque and Armenian langnages are also agglutinative, with this difference, that the roots which are joined together have been abbreviated, as in the Basque *ilhun* = twilight, from *hill* = dead + *egun* = day. To these languages it has been proposed to give the distinctive name of incorporating or polysynthetic languages. In inflectional languages, which are the most highly developed, the roots are capable of being modified by prefixes or suffixes, which were once independent words.

Languages, when classified genealogically, are divided into families or groups connected by a community of origin. Thus the Indo-European family (called also Aryan, or Indo-Germanic), is composed of seven great branches: the Indian, the Iranian or Persian, the Greek, the Italic, the Celtic, the Slavonic or Slavo-Celtic, and the Germanic or Teutonic. Each of these may again be subdivided. Thus the Germanic branch includes Mæso-Gothic, or the dialect of the Goths of Mæsia [Gothic]; the Low German languages, still spoken in the north of Germany, and including two important cultivated tongues, the Netherlandish and the English [English-language]; the High-German body of dialects, represented now by only a single literary language, the so-called German; and the Scandinavian division, written in the forms of Danish, Swedish, Norwegian, and Icelandic.

The Semitic family of languages is the next in importance. It includes Arabic, Syrian, or Aramaic, the Canaanitish dialects, chief among which are Hebrew and Phœnician, and the Assyrian and Babylonian dialects.

"Our ancient English Saxons *language* ie to be accompted the Teutonicke tonge."—*Verstegan: Restit. of Decayed Intelligence,* ch. vii.

3. The words or expressions used by a person: as, His *language* was disgraceful.

4. Words or expressions employed in or appropriate to any branch of knowledge: as, the *language* of chemistry.

5. Style; manner of expression in either speech or writing.

"Others for *language* all their cares express,
And value books, as women men, for dress."
Pope: Essay on Criticism, 305.

6. The inarticulate sounds by which irrational animals express their feelings or wants.

7. The expression of thought in any way, articulate or inarticulate, conventional or unconventional: as, the *language* of flowers, the *language* of the eyes, &c.

* 8. A nation, as distinguished by the use of a particular language.

"All the people, the nations, and the *languages* fell down and worshipped the golden image that Nebuchadnezzar the king had set up."—*Daniel* iii. 7.

9. A lodge, branch, or chapter of the knights of the Order of St. John of Jerusalem.

"The annual report of the Sixth or English *Language* of the Order of St. John of Jerusalem has now been published."—*Daily Chronicle,* Oct. 25, 1884.

II. *Music:* In an organ an open metal flue pipe consists of foot, and langnage, and body. The language is a flat piece of metal fastened by its edge to the top of the foot, and which, by its shape, only permits the air to leave the foot in one direction.

¶ *Language* is the most general term in its meaning and application. *Tongue, speech, idiom,* and *dialect* are applicable only to human beings. Language is either written or spoken, but a *tongue* is conceived of mostly as a something to be spoken; and *speech* is, in the strict sense, that only which is spoken or uttered. *Speech* is an abstract term, implying either the power of uttering articulate sounds, or the words themselves which are spoken, or the particular mode of expressing one's self. The *idiom* is the peculiar construction and turn of

a *language*. The *dialect* is that which is engrafted on a *language* by the inhabitants of particular parts of a country. *Languages* simply serve to convey the thoughts; *tongues* consist of words, written or spoken; *speech* consists of words spokeu.

Heated to 190° it turns brown and gradually decomposes. Strong nitric acid dissolves it, giving rise to an orange-red colour. Sulphuric acid gives with it a faint violet colour.

1. *Comp. Relig.:* [Lemur].

2. *Entom.:* The first condition of an insect on its issuing from the egg, when it is usually in the form of a grub, caterpillar, or maggot. (*Darwin.*) The name applied to an immature insect from the time that it breaks through the egg-shell, whatever state of development it may have reached *in ovo*. In the orders Orthoptera, Hemiptera, and Homoptera, the larvæ resemble the perfect insect, except in wanting wings; while in the Hymenoptera, Coleoptera, Neuroptera, Lepidoptera, and Diptera, they completely differ. Those larvæ which have legs and prolegs are called caterpillars; others, with a head and with feet or no feet are called grubs; and those which want both a head and feet maggots. As a rule, a larva cannot propagate its kind, but Wagner has discovered that this can be done by the maggot of a dipterous genus of insects, Cecidomyia; and Grimm that it can be done by the flies of the genus Chironomus.

3. *Zool.:* The term is sometimes used of the half-developed state of animals belonging to other classes. Thus Darwin (*Origin of Species*, ch. xiv.) speaks of the larva of a Cirriped.

Lateran-Councils, *s. pl.*

Ch. Hist.: In the church of St. John Lateran—"Omnium urbis et orbis ecclesiarum mater et caput"—five General Councils have been held, besides an important council, not œcumenical, against the Monothelites (q.v.) in A.D. 649.

1. The Ninth General Council, and the first held in the West, under Calixtus II., in 1123. More than 300 bishops and 600 abbots attended. Its object was to end the strife on Investiture between the Emperor Henry V. and the See of Rome.

2. The Second Lateran (Tenth General) Council was held in 1139. Innocent II. presided over more than 1,000 prelates. Anacletus II. was declared an anti-pope, Roger of Sicily, his champion, excommunicated, and silence imposed on Arnold of Brescia.

3. The Third Lateran (Eleventh General) Council, 1179, under Alexander III., decreed the necessity of a majority of two-thirds to secure the election of a pope.

4. The Fourth Lateran (Twelfth General) Council surpassed in importance all councils previously held. It was opened by Innocent III. in 1215, and had two definite objects—the recovery of the Holy Land and the internal reform of the Church; 412 bishops, 800 abbots, and the representatives of many Catholic sovereigns were present. The Bishop of Constantinople was made the first of the Eastern patriarchs, and the supremacy of Rome insisted on. The Council decreed the necessity of, at least, annual confession to one's parish priest, and defined the absolute Unity of God, the Roman doctrine concerning the sacraments, and transubstantiation.

5. The Fifth Lateran (Eighteenth General) Council was opened by Julius II. in 1512, and closed by Leo X. in 1517. It declared the decrees of the Schismatic Council of Pisa null, condemned the Pragmatic Sanction (q.v.), and approved the French concordat. It defined (in the bull *Pastor æternus*) the pope's authority over councils, and (in the bull *Apostolici regiminis*) condemned those who

held that the intellectual soul is mortal, or only one in all men. (*Addis & Arnold.*)

The Fourth Lateran (Twelfth General) Council, the Council of Trent (Twentieth General), and the Vatican Council (Twenty-first General, still unfinished), are the three most important Councils in the history of Christendom.

Lathes are of various kinds, and known by various uames, accordiug to the construction, mode of driving, &c. [¶] The parts of the lathe are:—The bed, sheers, cheeks, sides, on which the puppets, which form the head-stock and tail-stock, slide. The mandrel, or live spindle of the live head, and on which is the speed-pulley; the centres on the live or front spindle, and the dead or back spindle, respectively, on which the work is turned; the fly-wheel (of a foot-lathe), on which is the cord passing to the speed-pulley of the head stock; the treadle, or foot-board, to which the power is applied; the collar-plate, cone-plate, face-plate, chuck, or other means of conuecting the work; the rest for the tool.

2. *Weaving:* The wooden frame beam which forces up the weft; the lay or batten.

¶ The bar-lathe has a single beam or shear, generally of a triangular shape. On this the heads or puppets slip. The bed-lathe is the usual form, and has two parallel shears. The centre-lathe has head and tail stocks, which afford centres for each end of the work turned. The chuck-lathe supports the work being turned, by means of a grasping tool or socket on the mandrel of the head-stock. The geometric-lathe is an instrument for producing wavy or eccentric patterns with a general concentric arrangement. The hand-lathe is driven by a crank or bow, and is of small size, for the bench or table. The watchmaker's lathe is a small bench-lathe, sometimes having pivot centres, on which the work is turned by a bow, and sometimes a hand-lathe or a foot-lathe of small proportions. The last-lathe is a lathe for turning irregular forms. The mandrel-lathe supports the work on a spindle, which is attached to the axle of the head-stock, or on the head and tail centres, according to circumstances. The pivot-lathe is a small bench-lathe whose centres are the ends of rods clamped in the heads and not partaking of the revolution. The pole-lathe supports the work on puppets, and the cord passes from the treadle two or three times round the work, and then upward to a spring-bar. The power-lathe is driven by horse-power, water, or steam. The rose-engine lathe is a form of the geometric. The spindle-lathe has a rotating axis in the head stock, to which the work is attached. The spoke-lathe is a lathe for turning irregular forms. The turn-bench is a small portable lathe for the work beuch or desk.

B. *As substantive:*

Church Hist. (*Pl.*): A party in the Church of England, about the middle of the seventeenth century, who, wearied by the fierce religious disputes of the time, aimed at a broad or comprehensive system which might reconcile the contending parties, or at least diminish the vehemence of their controversies. They were attached to Episcopacy, but were prepared to welcome as brethren those who believed in other forms of church government. The right settlement of the question between Calvinism and Arminianism was not essential to salvation: it, therefore, need not cause alienation of feeling among those who were agreed as to essentials. The chief latitudinarians were John Hales, William Chillingworth, Henry More, Ralph Cudworth, Theophilus Gale, John Whichcote, and Archbishop Tillotson. They were opposed both by the Puritans and by the High Church party. The first of them that appeared were denounced as Socinians, Deists, Atheists, &c. But on the restoration of Charles II. they were advanced to high dignity. They were the precursors of the modern Broad Church party.

II. *Botany:*

1. The genus Laurus (q.v.), and specially the Bay, *Laurus nobilis,* the Laurus of the Romans and the Daphne of the Greeks. Linnæus called it *nobilis* because it was ancientiy reserved for priests, heroes, and sacrifices. In its native region—the south of Europe—it is thirty, forty, or even sixty feet high, but sends forth so many suckers and low shoots as to have a shrubby appearauce. The colour is deep green, inclining to olive; the ripe berries dusk, purple, or black. There are glands on the backs of the leaves, which excrete nectar. The berries, the leaves, and the oil have a fragrant smell, an aromatic astringent taste, and narcotic and carminative properties. Water distilled from them contains prussic acid.

2. *Cerasus Laurocerasus,* called the Common or Broad-leaved Laurel. It has oblong, lanceolate, remotely serrated pale-green evergreen leaves; flowers in racemes. A uative of Trebizond, but now abundant in Britain. Its leaves, bark, and fruit are virulent poisons.

3. The United States have two species of cherry laurel, *Prunus caroliniana* of the Southern States and *P. ilicifolia* of California. They are both small and handsome evergreens. The plants generally known as laurels in the United States, however, belong to the genus Kalmia, consisting of evergreen shrubs, with red, white, or pink flowers, generally in corymbs. The flowers are very delicate and beautiful, the corolla being in the shape of a wide and shallow bell. There are two well-kuown species, the Common Laurel of the lowland woods, and the Mountain Laurel, which occupies large tracts in the Alleghanies. It grows to a height of ten feet, the wood being very hard. The leaves are poisonous to many animals, and the plant has narcotic aud dangerous properties.

Laurentian-group, *s.*

Geol.: A vast series of rocks, 30,000 feet in thickness, and covering an area of at least 200,000 square miles north of the St. Lawrence river. It is lower, and consequently older, than the Cambrian. In consists of an immense series of crystalline rocks, gneiss, mica-schist, quartzite, and limestone. It is divided into Upper and Lower Laurentian. The Upper, more than 10,000 feet thick, cousists of stratified crystalline rocks, in which no organic remains have yet heen found. It mainly consists of felspars, containing from about one to seven per cent. of soda and potash. Sometimes they alone form mountain masses, at others they are associated with augite aud hypersthene. They are often granitoid in structure. The Lower Laureutian, about 20,000 feet in thickness, is unconformable with the Upper. It consists mainly of a reddish gneiss, with orthoclase felspar; interstratified with thin hornblendic and micaceous schists, with beds of usually crystalline origin, and others of plumbago. The limestoue may possibly be of animal, and the plumbago of vegetable origin, but the only known fossil is the *Eozoon canadense.* [Eozoon.] The Laurentian volcanic rocks of Ottawa, Argenteuil, &c., in Canada, consist of fine-grained dark greenstone or dolerite. They vary from a few feet to a hundred yards in thickness. They send forth branches, and are cut through by intrusive syenite. Sir Roderick Murchison and Dr. Geikie were of opinion that the fundamental gneiss of the Scottish Highlands and islands was of Laurentian age, and they constructed a geological map of Scotland ou this hypothesis.

la'-va, *s.* [Ital. = a torrent of rain overflowing the streets; from Ital. *lavare*; Lat. *lavo* = to wash; Sp. *lava*; Fr. *lave.* (*Mahn.*)]

Petrol. & Geol.: A term used vaguely of all molten matter existing within or flowing in streams from volcanic vents, but more specifically confined to the latter, the former being called trap. The lower part of it, which has consolidated slowly and under pressure, tends to be of stony consistency, whilst the upper is scoriaceous. If, however, the lava flow came first and became scoriaceous, it remains so, even if stony material be piled above it. The more compact lavas are often porphyritic, and contain crystals. So do the scoriaceous kinds, the crystals having been derived from older rocks and remained infusible when the original matrix in which they had been imbedded was melted. Lavas vary greatly in composition. Some are trachytic, as in the Peak of Teneriffe; many are basaltic, as in Vesuvius and Auvergne; others andesitic, as in the volcanos of Chili. Some of the most modern in Vesuvius consist of green augite, and many of those of Etna of augite and Labrador felspar. (*Lyell: Student's Elem. of Geology*, pp. 491, 492.) Rutley says that the lavas of Etna are for the most part plagioclase basalts rich in olivine; those of Vesuvius are leucite sanidine lavas. [LEUCITE, SANIDINE.]

lava-flow, *s.* A sheet of lava which has flowed forth from some more or less adjacent volcanic vent. The Congregation (confirmed by Urban VIII. in 1632) had a threefold purpose: the sanctification of its own members, the work of the missions, and the training of an exemplary clergy. They were expelled from France in 1792; allowed to return under Napoleon I.; and, under the Restoration, a house was assigned them in the Rue de Sévres. The missions in China and the Levant, left vacant by the suppression of the Jesuits in 1773, were transferred to the Lazarists. II. *Technically:*

1. *Alchemy:* Lead was known to the ancients, and assigned to the planet Saturn, and hence was represeuted by the alchemists by the same sign.

2. *Archæol., Hist., &c.:* Lead is one of the most aneiently known metals, and is mentioned in the books of Moses. It appears to have been confounded with the metal tin, Pliny being the first to distinguish them under the names *Plumbum nigrum* and *Plumbum candidum*, because of their different colours. It was produced in England duriug the Roman occupation, numerous pigs of it with Latin inscriptions having been found. It would appear probable it that was obtained even earlier, the remains of rude furnaces having been found in Derbyshire and other places.

3. *Chem.:* Symbol Pb". Atomic weight, 207. A diatomic metallic element known from the earliest ages. The lead of commerce is almost all obtained from the native lead sulphide, which occurs in veins, particularly in the clay-slate of Cornwall and mountain limestone of Cumberland. It is extracted from the native ore by roasting in a reverberatory furnace, with one-twentieth part of lime, and allowing free access of air. The ore (PbS) passes through several stages during the process of reduction, but finally yields up its sulphur as sulphurous acid. The metallic lead still containiug silver, antimony, and copper, is run off and submitted to the desilverisation process (Pattison's), which consists essentially of a concentration of the silver by repeatedly crystallizing the lead from its melted conditiou, the melting-poiut of the argentiferous alloy being lower than that of pure lead. When the alloy contains 300 ounces to the ton, it is placed in a furuace and a blast of air allowed to play over it, which removes the lead as oxide and leaves the silver in the pure state. Lead is of a bluish-white colour, and is one of the softest of metals. It may be cut with the uail, and leaves its mark upon paper. Its duetility and tenacity are low in the scale, but it may be converted iuto tolerably thin sheets, as well as drawn iuto wire. It fuses at 325°, and may with difficulty be obtained in cubic or octahedral crystals. Its sp. gr. = 11·38. The lead of commerce is often nearly pure, and can be obtained perfectly so by reduction of the pure nitrate. It is not acted upon by sulphuric and hydrochloric acids, but is readily dissolved by dilute nitric and acetic acids. Metallic lead, exposed to the action of air and pure water, is powerfully corroded, and as a result the water is found to have dissolved the oxide of lead. The impurities of most waters modify this tendency by formiug a thin film on the surface of the metal aud so preventing auy further oxidation. The presence of nitrates and ammonia favour the solution of lead, and sulphates aud phosphates diminish the tendency. As a sanitary precaution, slate cisterns are greatly to be preferred to leaden ones. Lead enters into the composition of type-metal, pewter, Britannia metal, and plumbers' solder. The best tests for lead are hydric sulphide, which forms a black sulphide, and potassic chromate, which gives a yellow precipitate of lead chromate.

4. *Knitting-machine:*

(1) Solder in which various members are imbedded, and by which they are attached.

(2) The tin socket which forms a haft for the knittiug-needle.

5. *Min.:* The United States is now a large producer of lead, and particularly Colorado, whose silver smelting works yield a large by-product of this useful metal. The principal mines and works are at Leadville, where the ore is native carbonate of lead. Much lead has also been obtained in Nevada, Utah, Idaho, New Mexico, Missouri, and Kansas. Lead is also found in several parts of Europe.

6. *Naut.:* A plummet or mass of lead used in sounding at sea. An ordinary hand-lead weighs from 7 to 11 pounds, attached to a line of 20 fathoms leugth. The line is marked at 2, 3, 5, 7, 10, 13, 15, 17 and 20 fathoms; the numbers between the marks are called deeps. Thus "by the mark twain," "quarter less 5," "and a half 7," "by the deep 9," indicate those depths respectively. The deep-sea lead weighs 25 to 30 pouuds, with a much larger line marked at every 10 fathoms.

(2) *Land-league:*

Hist.: An association projected by Mr. C. S. Parnell, M.P., which came into being at a meeting held in Dublin, Nov. 18, 1879. Nominally the programme was the "three F's"—fixity of tenure, fair rent, and free sale (of the tenant's interest); but many speakers at Land League meetings held Sunday after Sunday in different parts of the country, went so far as to demand that the soil should belong to the cultivator. Opposition by direct violence was deprecated, and recourse was had to boycotting. [Boycott.] This state of things continued till the end of 1880, when fourteen members of the Land League, of whom the most important were Messrs. Parnell, Dillon, Biggar, T. D. Sullivan, and T. Sexton, were indicted. The chief counts were "conspiring to prevent payment of rents, to defeat the legal process for the enforcement of payment of rents, and to prevent the letting of evicted farms." They were tried in 1881, but acquitted. On October 7, Mr. Gladstone denounced Mr. Parnell, and soon afterwards that gentleman, Messrs. Dillon, Sexton, O'Kelly, and the chief officials of the League, were arrested and imprisoned in Kilmainham. They issued a manifesto calling on the Irish tenants to pay no rent during their imprisonment. The Government replied by declaring the Land League an illegal body, and suppressed its branches throughout the country.

1. *Roman:* The oldest known Latin lectionary is that commonly attributed to St. Jerome, and known as the *Comes*, distinguished as *major*, if it contained the Gospels and Epistles for the year; as *minor* if only the beginnings and endings. It is undoubtedly of early date, but the question of authorship cannot be decided. The lectionary found by Dom Mabillon in the convent of Luxueil is interesting as showing that, according to ancient, Gallican use, three lessons were read at mass.

2. *Anglican:* In the article, "Concerning the Service of the Church," in the Prayer Book, general rules are laid down as to the reading of Scripture in Divine Service; the system of Daily and Proper Lessons was established in 1559; the tables were drawn up in 1599, and in 1661 the lectionary was settled in the form it kept for two centuries. A Royal Commission was appointed in 1867 to consider the rubrics and directions for conducting public worship. This Commission drew up a New Table of Lessons; its use was at first optional, but has been obligatory since Jan. 1, 1879.

Class. Myth.: A sacrifice of the nature of a feast offered to the gods, an evident survival of the idea common in early stages of religious development that divinities actually partook of the offerings presented to them. (See the apocryphal story of Bel and the Dragon.) On occasions of extraordinary solemnity, or in times of public calamity, the Greeks and Romans placed tables with food before images of the gods reclining on couches. According to Livy (v. 13), the first Roman lectisternium took place A.U.C. 354, when a terrible plague affected the cattle. These sacrificial feasts were of two kinds—ordinary, occuring almost daily (Liv. xlii. 30); and extraordinary, occurring at intervals, and lasting from three to eight days, or even for a longer period (Liv xii. 10).

Lectors exist in the Greek Church and among the Copts, Syrians, Jacobites, and Nestorians. The Anglican communion recognizes lay lectors, who are set apart for their duty by a special form.

And in case of a deficiency of assets, all the general *legacies* must abate proportionably, in order to pay the debts; but a specific *legacy*, of a piece of plate, a horse, or the like, is not to abate at all, or allow anything by way of abatement, unless there be not sufficient without it. "In attempting to classify these persistent modifications [of the human race] after the manner of naturalists, the first circumstance that attracts one's attention is the broad contrast between the people with straight and wavy hair, and those with crisp, woolly, or tufted hair. Bory de St. Vincent, noting this fundamental distinction, divided mankind accordingly into the two primary groups of *Leiotrichi* and Ulotrichi—terms which are open to criticism, but which I adopt . . . because they have been used. It is better for science to accept a faulty name which has the merit of existence than to burthen it with a faultless newly-invented one."—*Huxley: Critiques & Addresses* (1873), p. 150.

Church History:

1. *Roman Church:* A fast—formerly of varying duration, but now of forty days—observed as a preparation for the Easter festival. A fast prior to this solemnity was customary from the earliest times, but it is not till the fourth century that we find the Lenten period definitely specified by the word τεσσαρακοστή, in Can. 5 of the Council of Nice. Sozomen (*H. E.*, vii. 19) says the Westerns generally "kept Lent for six weeks, the Church of Constantinople and the neighbouring provinces for seven." The four days before the First Sunday in Lent, necessary to make up the full tale of forty days—(six weeks = thirty-six days, for Sunday is never a fasting-day)—to correspond with the miraculous fasts of Moses (Exod. xxxiv. 28), of Elias (1 Kings xix. 8), and of Our Lord (Matt. iv. 2), were introduced in the ninth century. The severity of the Lenten fast is now much modified, and the extent (both as to time and quantity) to which lacticinia may be used is made known by the Lenten indults published by the bishops, and read in all the churches of the diocese at the parochial mass.

2. *Greek Church:* The Greek Lent lasts for seven weeks—thirty-five days, for on all Saturdays (except Holy Saturday), on the Feast of the Annunciation, and on all Sundays, the law of fasting is not in force. Strict abstinence from flesh-meat and lacticinia begins on the Monday in Quinquagesima week.

3. *Anglican Church:* In the "Table of Days of Fasting and Abstinence," the Forty Days of Lent staud first; but from the Reformation till about the middle of this century the practice of fasting gradually fell into desuetude. With the Oxford movement came an endeavour to restore aucieut practices aud discipline; and the influence of the High Church clergy has beeu productive of a stricter observance of this penitential season throughout the Church, aud of practice, with regard to fasting, more in accordance with the Homily "Of Good Works" thau had prevailed for a long time previously.

It is bounded on the north by Leo Minor, on the east by Virgo, on the south by Sextans, and on the west by Cancer. It contains about a hundred stars visible to the naked eye. Its chief star (α Leonis) is Regulus; this and γ Leonis, with some smaller stars, form a figure like a sickle. From its vicinity the November meteors radiate. Deneb or Deneba (β Leonis), in the extremity of the Lion's tail, and δ Leonis form a trapezium. A line drawn through the pole star and γ Ursæ Majoris, the lowest of the four in the Great Bear, passes through Deneb, and one connecting Deneb and Regulus will, if prolonged, pass nearly through Arcturus. ρ Leonis, viewed through a telescope, has a blood-red aspect.

(2) The fifth sign of the zodiac, being between 120° and 150° of the ecliptic, reckoning from the vernal equinox. Owing to "precession" it now begins in the constellation Cancer. The sun enters the sign Leo about July 21st.

lē'-ō-nīne (I),* le-o-nin, *a.* & *s.* [Fr. *léonin*, from Lat. *leoninus*, from *leo* (geuit. *leonis*) = a lion; Ital. & Sp. *leonino.*]

B. *As subst.:* A name given to a spurious copper coin of the value of about a halfpenny, introduced iuto England from abroad during the reign of Edward I., and so called from its bearing the figure of a lion.

lē'-ō-nīne (2), *a.* [Etym. uncertain; possibly the same as *leonine* (1), having reference to what Neale, translating Bernard de Morlaix, calls "the Leoniue sonorousness of the verses," or from Leouius, a canon of Notre Dame at Paris, an adept in the method of poetic composition to which the term is applied.] An epithet used to describe pentameter or hexameter verses, the last syllable of which rhymes with the syllable following the cæsura, as—

"Addita sunt pœnis aspera verba meis."
Ovid: Ex Ponto, ii. 7, 56.

"Agricola incurvo terram molitus aratro."
Virgil: Georg. i. 494.

The question whether the rhyming was accidental or intentional has given rise to much controversy among French prosodists: de Faletz having found 912 such rhymes in Virgil, supported the latter view, which was attacked by Quicherat, who showed that in the majority of cases—as in those cited above—the rhyme was between a substantive and its epithet. From the exceptional usage of the Latins a rule was developed. Leonine verses were common iu the hymns of the medieval church; aud long poems were composed in leonine measure or in some variant of it. An excellent example is the *De Contemptu Mundi* of Bernard de Morlaix. The metre is "continuous dactylic, except the final trochee or spondee;" the second and fourth feet rhyme, as does the last foot of the first verse with the last foot of the second, and so on—

"Urbs Syon inclyta, turris et edita littore tuto,
Te peto, te colo, te flagro, te volo, canto saluto."

At the time of the Renascence leonine verses were often used as a kind of *memoria technica.* Many of the precepts of the medical school of Salerno are in leonine pentameters:

"Ut sis nocte levis, sis tibi cœna brevis."

*** lē'-ō-nīne-lў,** *adv.* [Eng. *leonine* (1); *-ly.*] In a leouine manner; like a lion.

Bot.: A genus of Berberidaceæ, tribe Nandineæ. *Leontice Leontopetalum*, the Lion's

leaf, has leaves supposed to resemble in form the imprints of a lion's foot. It grows in the south and east of Europe and in Asia. The root, called Lion's turnip, is used at Aleppo as a substitute for soap, and by the Turks as a remedy for overdoses of opium.

lē-ŏn'-tō-dŏn, *s.* [Gr. λέων (*leōn*) = a lion, and ὀδούς (*odous*), genit. ὀδόντος (*odontos*) = a tooth, from the tooth-like divisions of the leaves.]

Bot.: A genus of Compositæ, sub-order Ligulifloræ (Cichoraceæ), tribe Scorzothereæ. It consists of perennial milky herbs, bearing simple branched scapes. The heads are yellow; the involucral bracts many, in several series, the outer ones smaller; the receptacle flat, naked; the fruit terete, grooved; the pappus hairs rigid, in one or two series. About twenty-five species are known. The dandelion, formerly named *L. Taraxacum*, now *Taraxacum officinale*, is a native of Europe, but has become one of the commonest wild flowers of the United States.

Bot.: Motherworts: a genus of Labiates, family Lamidæ. They have a tubular five- to ten-ribbed calyx; a two-lipped corolla, the upper one flat, entire, and hairy, the lower one patent, trifid; the anther cells nearly parallel. Ten are known. *Leonurus Cardiaca*, a pale roseate, mint-like flower, is a denizen, not a native, of Britain. It is given in chest complaints.

lĕop'-ard, *leop-art, *lib-bard, *s.* [Fr. *léopard*, from Lat. *leopardus;* Gr. λεόπαρδος (*leopardos*) = λεοντόπαρδος (*leontopardos*), from λέων (*leōn*), genit. λέοντος (*leontos*) = a lion, and πάρδος (*pardos*) = a pard, from the animal being supposed to be a cross between a pard or panther and a lioness; Sp., Port., & Ital. *leopardo.*]

Zool.: Felis pardus, sometimes called the panther (q.v.)—"the "pard" of Elizabethan writers. It has been known from early historical times, and has a wide geographical range, being found throughout the African continent, the whole of the South of Asia, and in Ceylon, Java, Sumatra, and Borneo. It ranks third in importance in the family Felidæ; varying in length from 3½–4½ feet; tail measurement 2½–3 feet, height at shoulder about 30 inches, but larger and smaller specimens have been met with. Colour, pale fawn to rufous-buff, thickly studded with dark rosette-shaped spots, which unite and form bands on the medio-dorsal line, the hind-quarters, and legs; the tail is covered with similar spots; white beneath and on the inside of the limbs. The leopard is fierce and bloodthirsty, often killing far more than it can devour, either from love of slaughter or for the sake of the fresh blood, and lies in ambush for or steals stealthily on its prey, which consists of almost any animal it can overcome, though it is said to eviuce a preference for the flesh of dogs, and, strange to say, for that of persons suffering from small-pox. In India it often attacks women and children, and instances have been known of "man-eating" leopards. Prof. Flower considers the Black Leopard of Java (described sometimes as *Leopardus* or *Pardus melas*) to be a case of melanism, and not a distinct species. This animal has the appearance of an ordinary leopard painted black; but the spots are still visible, being of a more intense hue than the rest of the skin. The Hunting Leopard (*Felis jubata*) is the Cheetah (q.v.), and it is to this animal that Jeremiah probably refers (xiii. 23).

leopard-cat, *s.*

Zool.: Felis Bengalensis, a beautiful Indian species. Yellowish gray to bright tawny, white below, longitudinally striped on head, shoulders, and back, spots on the side. Extreme length from thirty-five to thirty-nine inches, of which about twelve are made up by the tail. Occurs in India from the hilly regions to Ceylon, and extends westward to Java and Sumatra. It is extremely fierce, and is said to drop on deer, and cat its way into the neck.

lĕp'-ĭ-dĭn, *s.* [Eng., &c., *lepid(ium);* suff. *-in.*]

Chem.: $C_{28}H_{20}O$, Lepidene. A compound discovered by Zinin in 1867. It is obtained together with dibenzyl and an oily body by heating benzoin with fuming hydrochloric acid, and separatiug the other products by means of cold alcohol, in which it is insoluble. It crystallizes from boiling alcohol in feathery groups of flat needles, which melt at 176°. It is insoluble in water and cold alcohol, but slightly soluble in boiliug alcohol, in ether, and in boiling glacial acetic acid. Dibromolepidin, $C_{28}H_{18}Br_2O$, is prepared by adding bromine to lepidin dissolved in acetic acid. It forms needle-shaped crystals, melting at 190°. Oxylepidin, $C_{28}H_{20}O_3$, is formed by the action of nitric acid on a boiling solution of lepidin in acetic acid. It yields four kinds of crystals: viz., needles, tablets, short four-sided prisms, and microscopic octahedrons. Isolepidin, $C_{28}H_{20}O$, isomeric with lepidin, is produced by the dry distillation of oxylepidin. It crystallizes in four-sided plates, which melt at 150°.

lĕp'-ĭ-dīne, *s.* [Eng., &c. *lepid(ium); -ine.*]

Chem.: $C_{10}H_9N$. An oily volatile base, homologous with chinoline, obtained together with that base by distilling quinine or cinchoniue with water and hydrate of potassium, the portion coming over above 270° being almost pure lepidiue. It may also be prepared by adding sodium amalgam to lepidine, and boiling the resulting yellowish oil with water and an acid. On cooling it deposits crystals of a bright scarlet colour, which must be

dried in the dark, since they are altered in colour by light. When nitric acid is used, the solution on cooling gives a crop of red crystals, having the composition of dilepidine nitrate, $C_{20}H_{38}N_2{\cdot}HNO_3$. Chinoline behaves in a similar manner, the red substance yielding with hydrochloric acid, crystals of dichinolin hydrochloride $C_{18}H_{14}N_2{\cdot}HCl$.

lĕ-pĭd'-ĭ-ŭm, *s.* [Lat., from Gr. λεπίδιον (*lepidion*), dimin. of λεπίς (*lepis*) = a scale. Named from the form of the little pouches.]

1. *Bot.:* Pepperwort; the typical genus of the family Lepididæ (q.v.), or the tribe Lepidineæ. The pod is dehiscent, two to four seeded; the petals are short or wanting. It consists of plants generally with small white flowers, and two, four, or six stamens. Sixty or eighty are known. Four are wild in Britain —*Lepidium latifolium* (the Dittander), *L. ruderale*, *L. campestre* (the Pepperwort), and *L. Smithii*. Another, *L. Draba*, is an alien. *L. sativum* is the Garden Cress. It has the pod orbicular winged, leaves variously cut, and smooth branches. It is a native of Persia, Cyprus, &c., growing in corn-fields. It has long been cultivated in Europe, parts of Asia, &c. Its leaves are used for garnishing dishes. It yields an oil like mustard-oil. The plant is carminative, diuretic, and, according to the Hindoos, tonic and alterative; they give it in hiccup, diarrhœa, and skin diseases. *L. oleraceum* grows abundantly on the shores of New Zealand, and was eagerly sought after by the early navigators as a preventive of scurvy. *L. Piscidium* is used in the Society Islands to intoxicate fish, with a view to their capture.

2. *Chem.:* $C_6H_5{\cdot}CH_2{\cdot}CN$. The volatile oil of garden cress (*Lepidium sativum*). Hofmann has lately shown this to consist of a toluo-nitril.

Palæobot.: A genus of Lycopodiacæ. It consists of a cylindrical stem or trunk covered with leaf-scars, and branching dichotomously. There is a large central pith surrounded by a continuous sheath of scalariform vessels, these again being enveloped in a thick bark, mainly of bast-tissue, with a dense outer rind. The scars are arranged in a quincunx order, the branches are covered with very numerous slender pointed leaves, and the fructification consisted of Lepidostrobi (q.v.). The spores, as Mr. Carruthers, F.R.S., &c., has ascertained by careful measurement, are no larger than those of modern Lycopodiaceæ, which, Sir Chas. Lyell points out, must have tended to facilitate their diffusion by the wind. While modern Lycopodiaceæ are generally herbaceous trailing plants, a stem of *Lepidodendron Sternbergii*, found in Jarrow Colliery, near Newcastle, was forty-nine feet long. About forty species of the genus are known, half of them from Britain. Lepidodendron is supposed to extend from the Silurian to the Permian, attaining its maximum in the Carboniferous formation.

Entom.: An order of Insects, having the wings clothed with scales implanted in the wings, with their margins overlapping other scales; it is these, and not the wings themselves, that are so gaily coloured. The wings are four. The mouth consists of an antlia, or long spiral proboscis or tongue, by means of which they feed on honey in the nectaries of flowers, which is their appropriate food. They undergo a complete metamorphosis, the parent generally depositing her eggs on some plant; these being hatched as minute caterpillars, at once begin to eat voraciously, increasing largely in size, and casting their skin repeatedly. On becoming full grown, they pass into the chrysalis state, emerging in due time as full-grown winged insects. Formerly they were divided into three suborders or tribes: Butterflies, Sphinxes or Hawk-moths, and Moths, the first having club-shaped antennæ, the second having the thickest part of the antennæ towards the front, and tapering in both directions, and the third having them, if not feathery, then, becoming gradually thinner from the base to the tip. The butterflies are the most brightly coloured, and fly by day; the sphinxes of less brilliant tints, fly during the twilight; the moths, normally of sombre hue, are nocturnal. The last two suborders are now combined, and only two primary divisions recognised: (1) Rhopalocera, containing the Butterflies; (2) Heterocera, comprising Hawk-moths and Moths. More than 50,000 Lepidoptera are known; Britain contains 1,976 or more.

lĕp-ĭ-dō-sĭr'-ĕn, *s.* [Gr. λεπίς (*lepis*), genit. λεπίδος (*lepidos*) = a scale, and σειρήν (*seirēn*) = a siren; here referring to an amphibian genus.]

Zool.: A genus of fishes belonging to the division Palæichthyes, the order Dipnoi (Mud-fishes), and the family Sirenoida. *Lepidosiren paradoxa*, the South American Mud-fish, above three feet long, is found in the river Amazon. It is closely allied to Protopterus, but has only five branchial arches with four intervening clefts, fifty-five ribs, small eyes, covered with skin. Sir Richard Owen shows that it is only by the organ of smell that it is proved to be a fish and not a reptile. Mr. Darwin believed that the reason why a fish of a pattern so antique has survived is, that it is an inhabitant of fresh water, where the struggle for existence is less severe than in the ocean.

lĕp-ĭd-ŏs-tē′-ĭ-dæ, *s. pl.* [Mod. Lat. *lepidoste(us)*; Lat. fem. pl. adj. suff. *-idæ.*]

Ichthy.: American Bony-Pikes or Garfishes, a Ganoid family. They have a flexible body, and a head moving backward and forward in a way impossible to other fishes, and such rapidity and energy of movement that they can make their way up the rapids in a river. The reason is that the vertebræ are not cupped at each end, but have a rounded articular surface in front, with a concavity behind. In some respects they approach reptiles. They are fresh-water fishes of voracious appetite. Habitat, the United States, Mexico, and Cuba.

Weaving: An arrangement in a loom by which the yarn is paid off from the beam at such a rate as it shall be required by the weaving process, and which is dependent upon the rate of the picks, the sizes of the warp and weft thread, the compactness with which it is beaten up by the lay. The take-up is the winding on to the cloth-beam of the completed web, and proceeds coincidently with the let-off from the yarn-beam. Regularity of let-off is secured by making the rate of surface motion of the yarn-beam depend upon the tension of the yarn; and the rate of revolution of the beam, to secure equal speed of let-off, will become rapid as the bulk of yarn diminishes from the roller.

Body letter is type in which the main portion of a book or paper is printed. [FOUNT.] Body letter is known by different names, according to the size of the type; the sizes in most common use being: Pearl, Nonpareil, Minion, Brevier, Bourgeois, Long Primer, Small Pica, and Pica.

¶ A *letter* is, in its nature, altogether familiar; this term may be used for whatever is written by one friend to another in domestic life, or for the public documents of this description which have emanated from the pen of writers, as the *letters* of Madame de Sevigné, the *letters* of Pope or of Swift; and even those which were written by the ancients, as the *letters* of Cicero, Pliny, and Seneca; but in strict propriety those are entitled *epistles*, as a term most adapted to whatever has received the sanction of ages, and by the same rule, likewise, whatever is peculiarly solemn in its contents has acquired the same epithet, as the *epistles* of St. Paul, St. Peter, St. John, St. Jude; and by an analogous rule, whatever poetry is written in the *epistolary* form is denominated an *epistle* rather than a *letter*, whether of ancient or modern date, as the *epistles* of Horace, or the *epistles* of Boileau. *Letters* and *literature* signify knowledge derived through the medium of written *letters* or books, that is, information; *learning* is confined to that which is communicated, that is, scholastic knowledge. Such an expression as men of *letters*, or the republic of *letters*, comprehends all who devote themselves to the cultivation of their minds; *literary* societies have for their object the diffusion of general information; *learned* societies propose to themselves the higher object of extending the bounds of science, and increasing the sum of human knowledge.
